

Standardization Activities on ICT

18th June 2007

Isao SUGINO
Senior Deputy Director
Standardization Division
MIC Japan

“Very primitive questions”

(Q1) What is “Standard” ?

- “Something established by authority, custom, or general consent as a model or example”

(Merriam-Webster Online Dictionary)

- “Some arrangement for simplification and unification among concerned people in order to fairly share a maximized profit and utility”

(Some university professor in Japan)

(Q2) Then, what is “Standardization” ?

- “Organized activities to set up “Standards” and put them to practical use”

(Some university professor in Japan)

Interconnectivity and Interoperability ensured through Standardization

Different networks

Standardization, such as on

- Coding,
- Signaling and
- Protocol,

is required for Interconnectivity and Interoperability.

- A variety of services
- A variety of terminals

- ① between Networks
- ② between Network and Terminal
- ③ between Terminals

Merits of Standardization

1 Efficient provision of telecommunications services

- (1) Generalizing network facilities, terminal equipment, associated parts, etc.
- (2) Assuring interconnectivity (to make more open access to networks)
- (3) Assuring security, proper quality, etc.
- (4) Reducing costs due to mass production
- (5) Facilitating international procurement
- (6) Utilizing telecommunication resources such as radio waves and telecommunication circuits, with efficiency.

2 Promotion of competition in the telecommunications field

- (1) Reducing entry barriers by assuring interconnectivity
- (2) Expanding global markets through easily setting up international networks
- (3) Increasing multi-carriers and multi-vendors of telecommunication systems,

etc.

Categories of Standards

- “mandatory” / “voluntary”
- “de jure” / “de facto”
- “global” / “regional” / “domestic”

“mandatory” / “voluntary”

“mandatory” standards

- Necessary and lowermost conditions for some viewpoints, such as “No harm to networks” and effective use of resources
- Enforced in the form of laws and regulations

“voluntary” standards

- Not enforced but accepted
- Convenient for practical reasons

For example,

#1: Output voltage of telephone terminals ... “mandatory”

- Too much output voltage of terminal would damage network.

#2: Assignment of telephone numbers ... “mandatory”

- to avoid the “double” assignment to different telephones
to utilize the numbering resources most

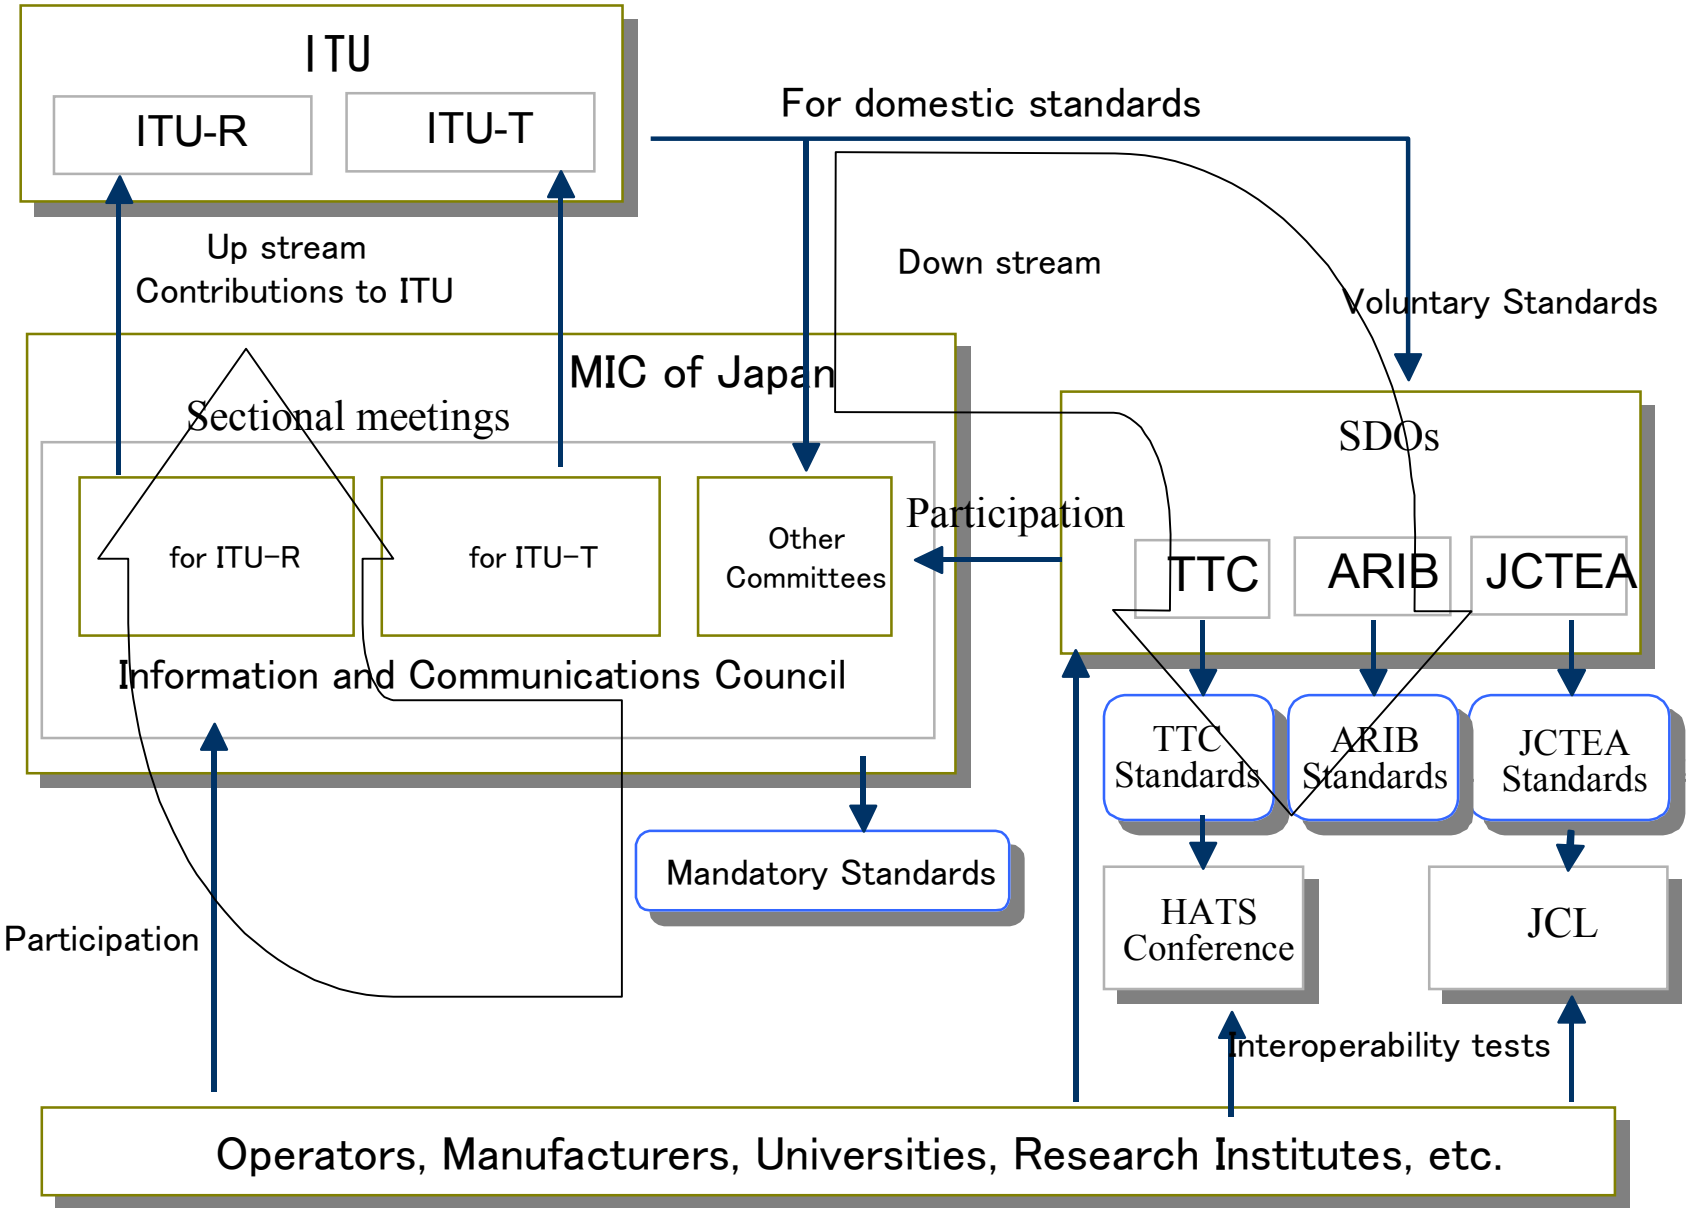

#3: Protocols for FAX ... “voluntary”

#4: Mobile phone systems ... “mandatory”

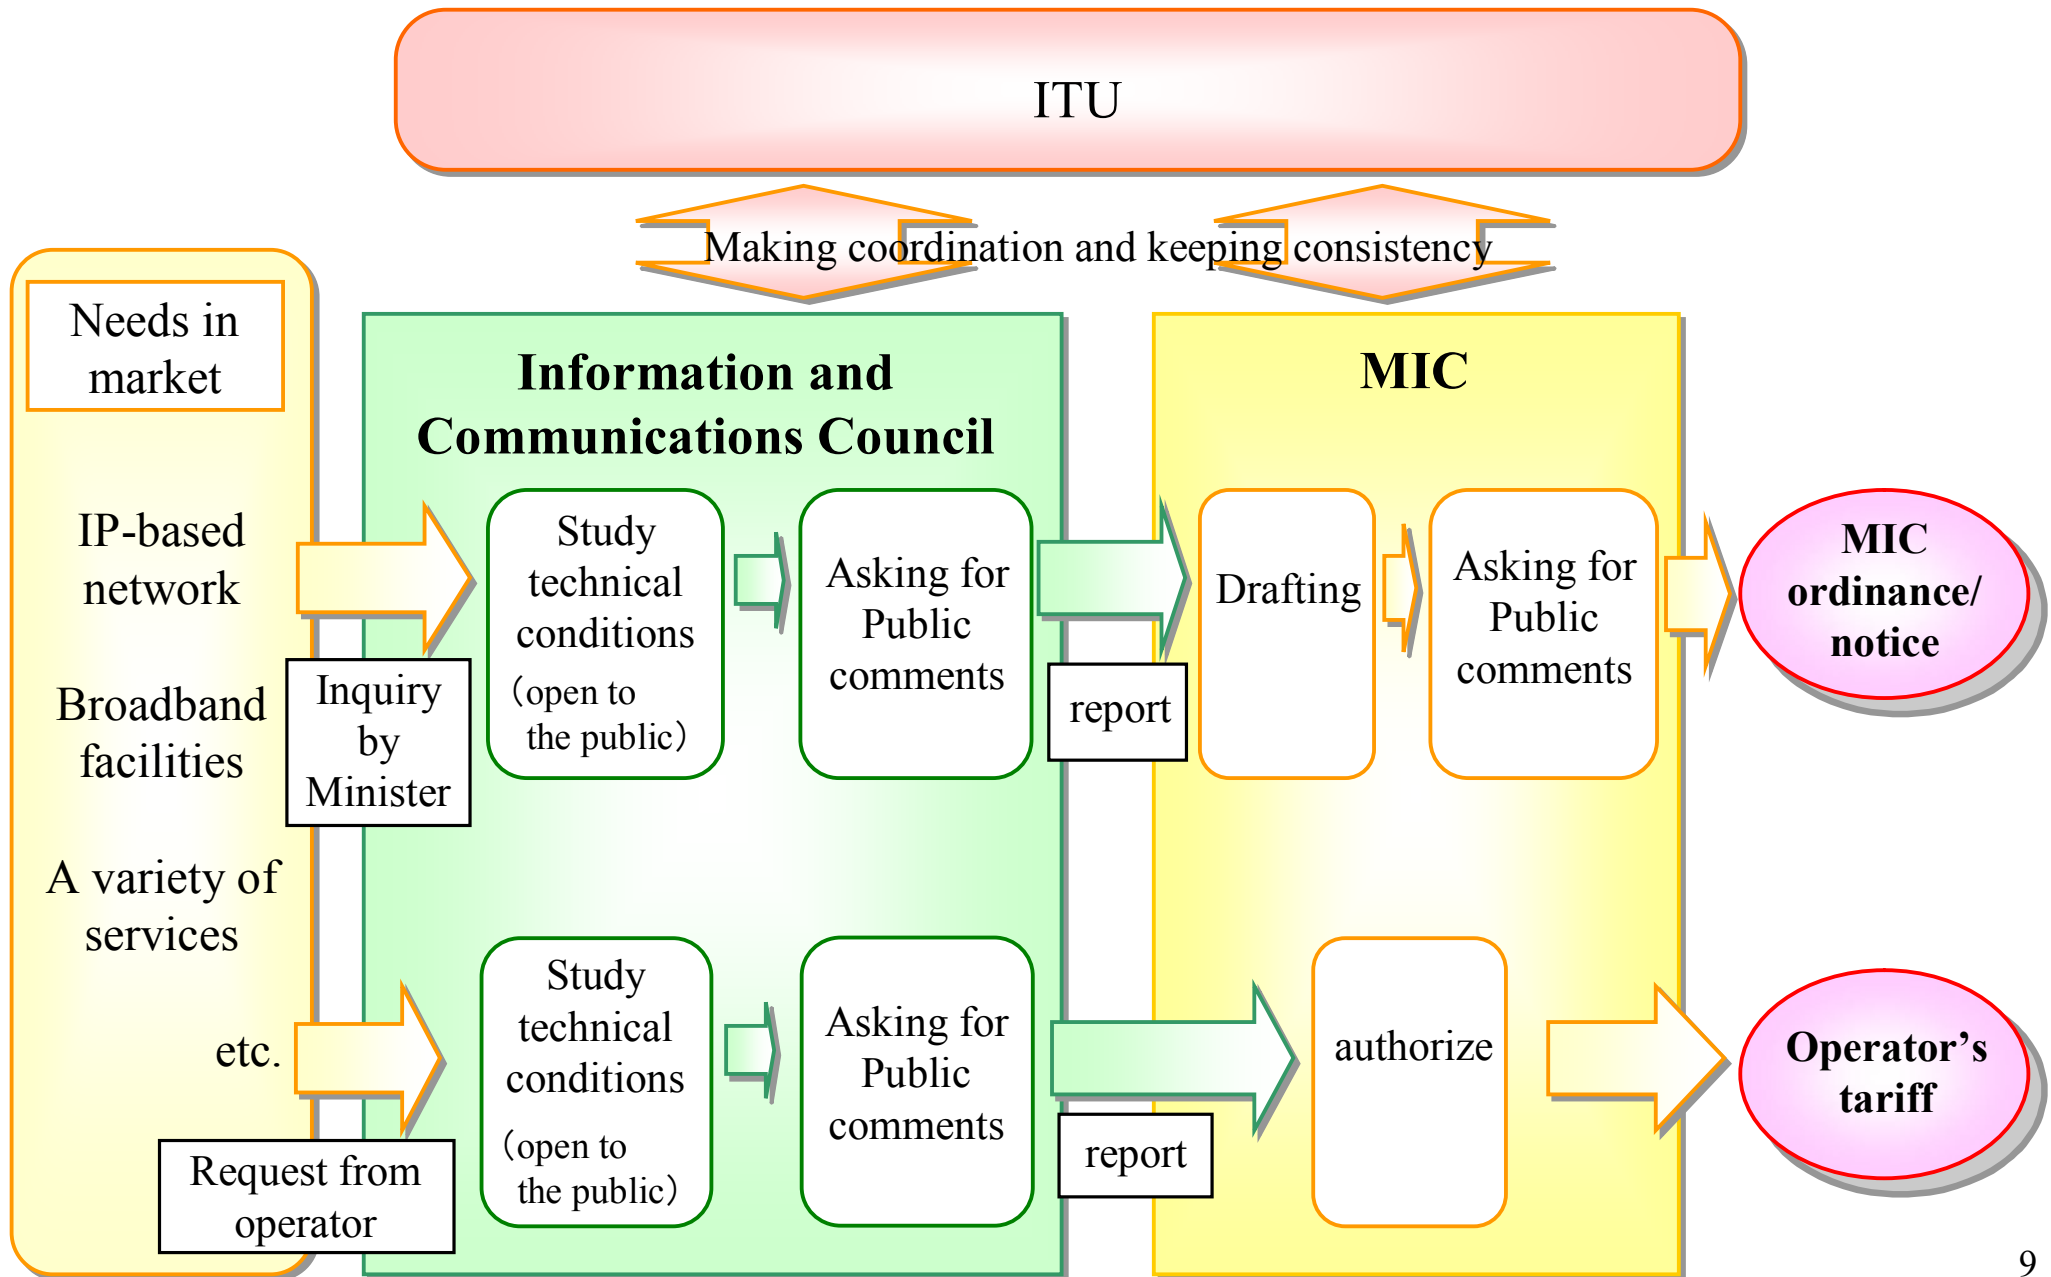

- to avoid interference
to utilize the radio frequency resources most

#5: Mobile internet access ... “voluntary”

Standardization activities in Japan (for ITU Standards)

Due process for establishing mandatory standards

(Q3) Does “Standard” guarantee interoperability?

Sorry,...but maybe not, because

“Standard” does not include every detail of technical condition.

“Standard” will allow interpretation on implementation.

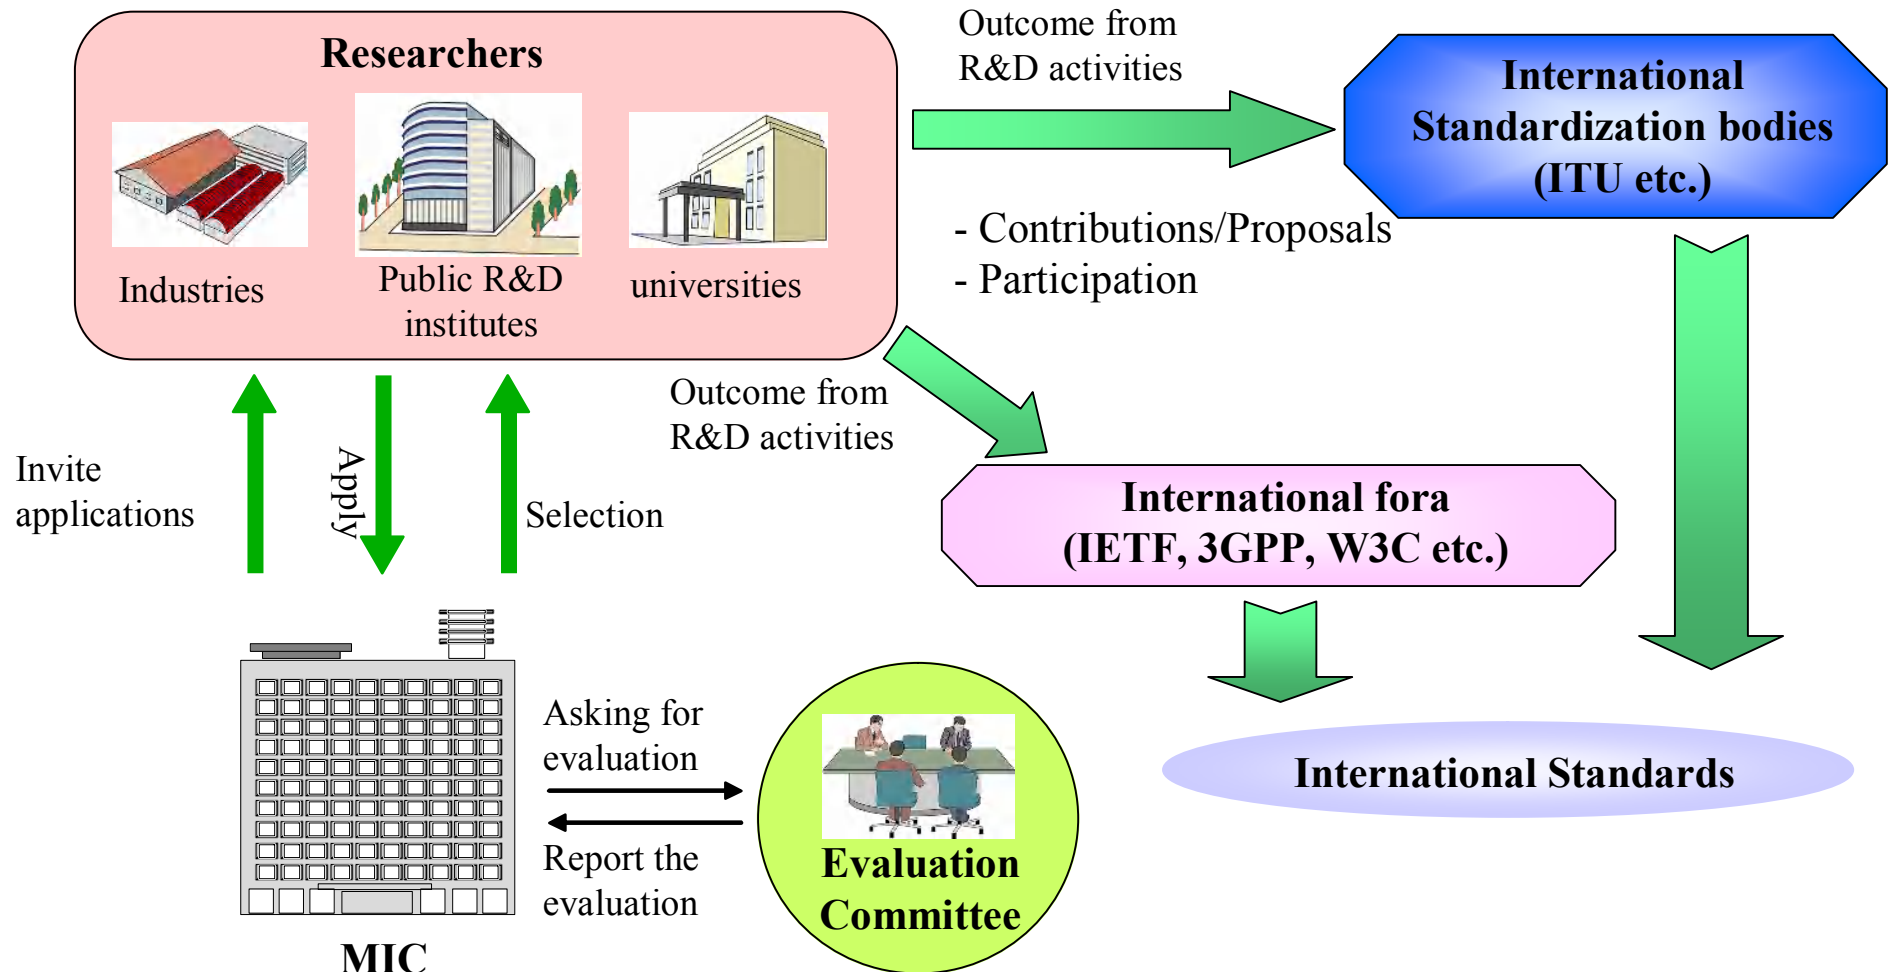

Interoperability tests are required in the product development stage.

- (1) Identify the target: standards, functions, products, etc.
- (2) Study the details of technical conditions and avoid misunderstanding and misinterpretation.
- (3) Confirm the specific procedures of tests.
- (4) Run a trial interconnection of products manufactured in accordance with the standards and make the necessary adjustments.

SCOPE:

Strategic Information and Communications R&D Promotion Programme

Policy for Intellectual Property Right (IPR) in ITU

The ITU requires the submittal of an oath declaration concerning patent approval from those holding patent rights necessary for implementation as ITU standards.

This oath declaration displays intent (license) for display of will by the owner of the patent in question.
