

Session 5.8

Supporting Network Planning Tools I

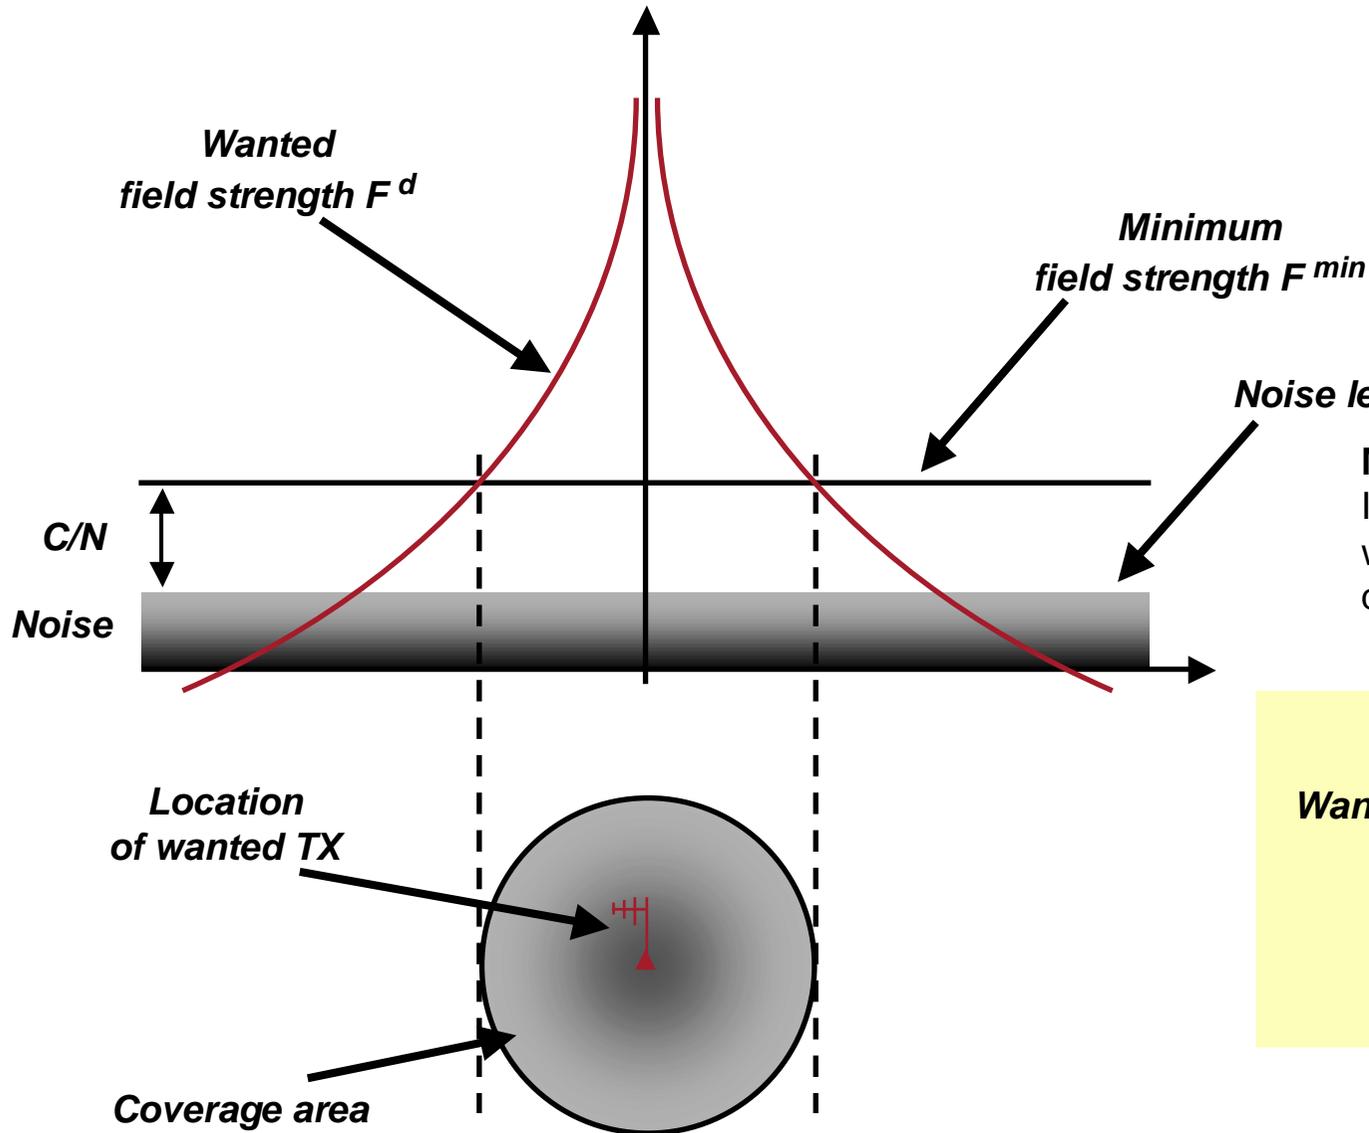

by

Roland Götz

Spectrocan / LS telcom AG

Interference Analysis

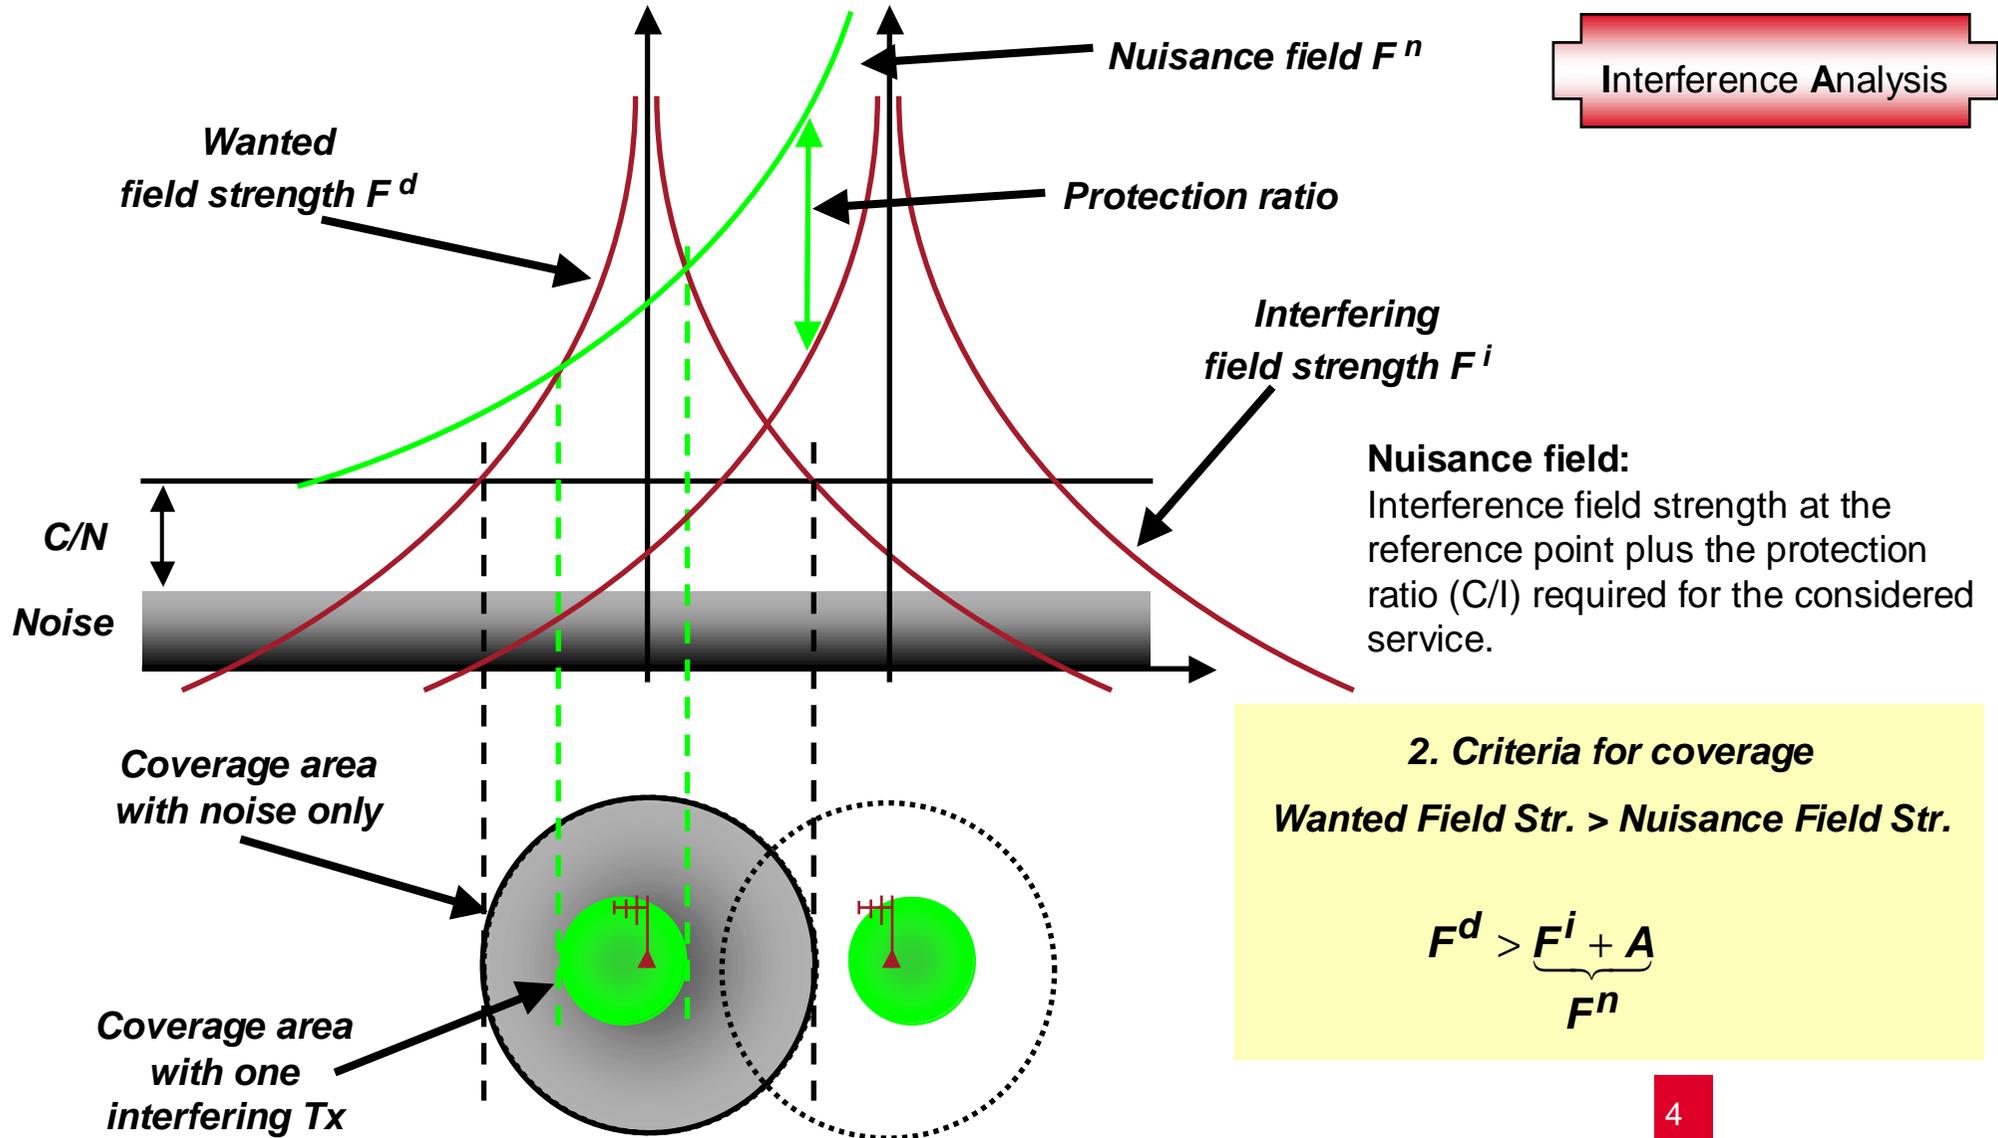

Minimum field strength (C/N):
It is a minimum field strength level which is necessary to fulfil the signal quality for coverage.

1. Criteria for coverage

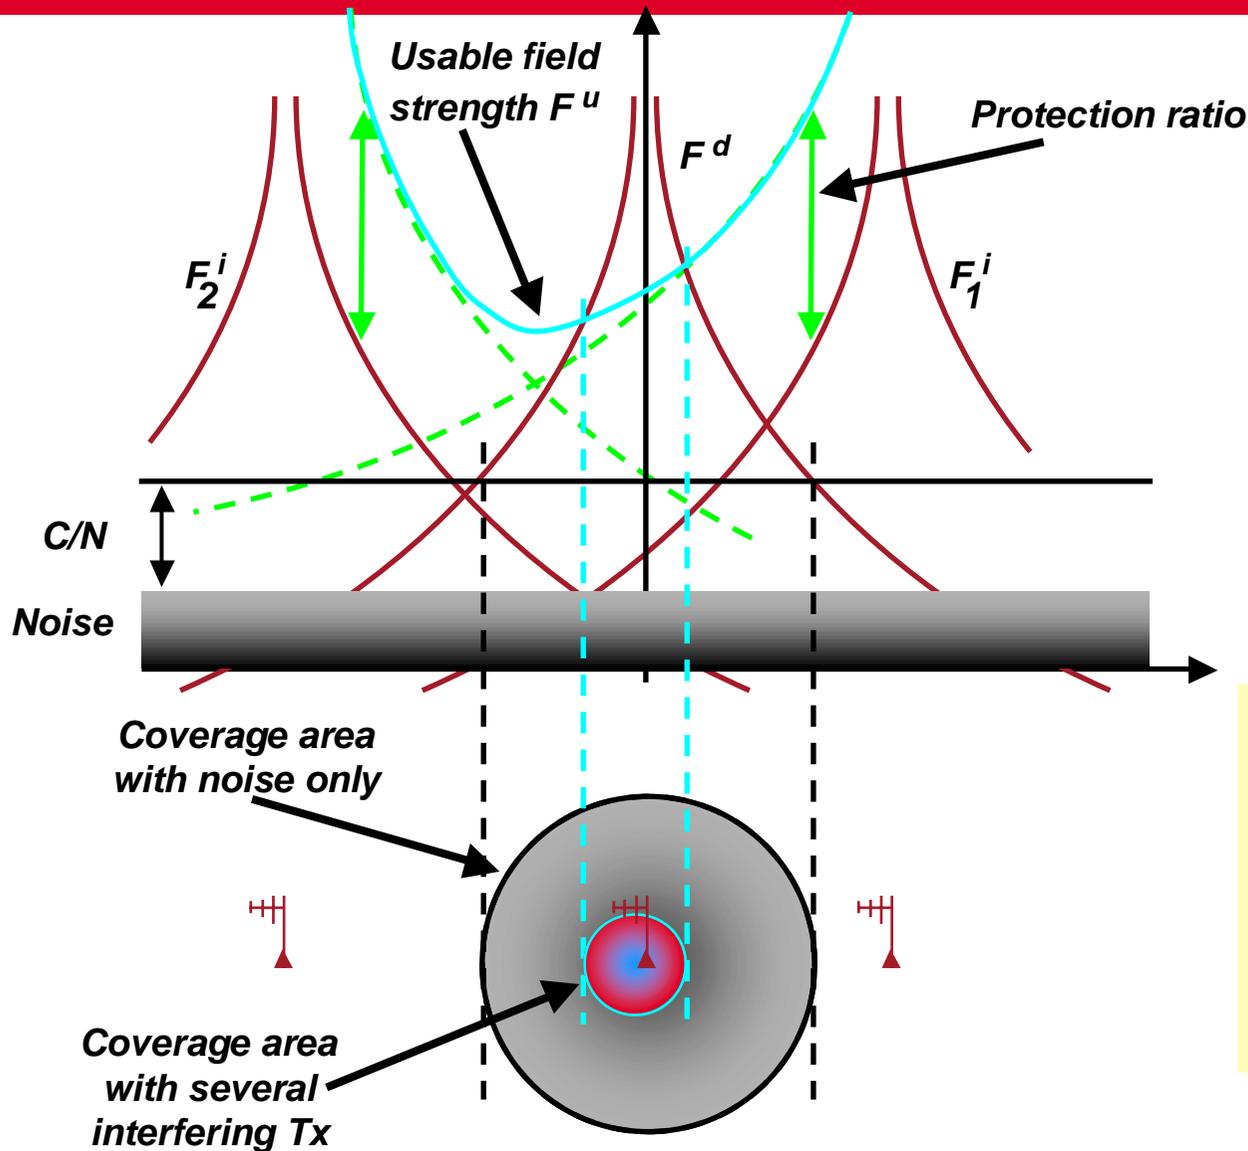

Wanted Field Str. > Minimum Field Str.

$$F^d > \underbrace{F^N + C/N}_{F^{min}}$$

Interference Analysis

Interference Analysis

Usable field:

Summation of the nuisance fields of the interfering transmitters according to a certain summations algorithm (maximum, simplified multiplication, ...)

It is the fieldstrength value which is *usable* by a possible new site just to fulfill the condition of coverage ($C/I > 0$) by the existing interferer situation.

3. Criteria for coverage

Wanted Field Str. > Usable Field Str.

$$F^d > \underbrace{\sum_{j=1}^M F_j^n}_{F^u}$$

In modern Planning Tools, the cumulation of the single interfering fields can be done in several different ways.

The various procedures differ in the way how simplifications are used to minimize the calculation effort.

In the following a short overview is given for the procedures which are most often used in interference calculations.

Non-statistical methods:

- Maximum procedure
- Power-sum method

Statistical methods:

- Integration method
- Log-normal method
- Multiplication method
- Simplified multiplication method
- Simplified Log-normal method
- Trilinear Log-normal method

Most use is made of the power-sum method and the simplified multiplication method

Reference CCIR Report 945-2: Methods for the Assessment of Multiple Interference

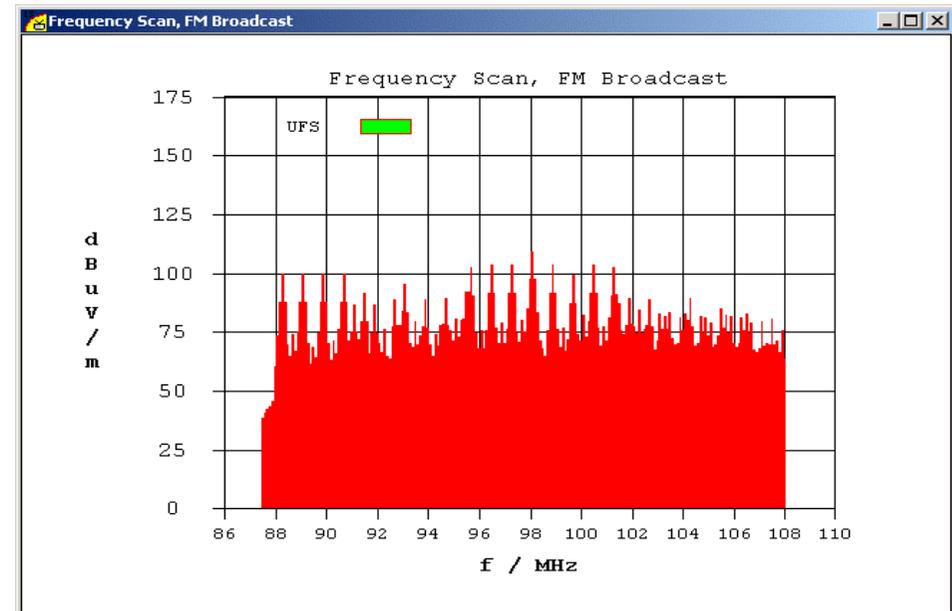

Frequency Scan

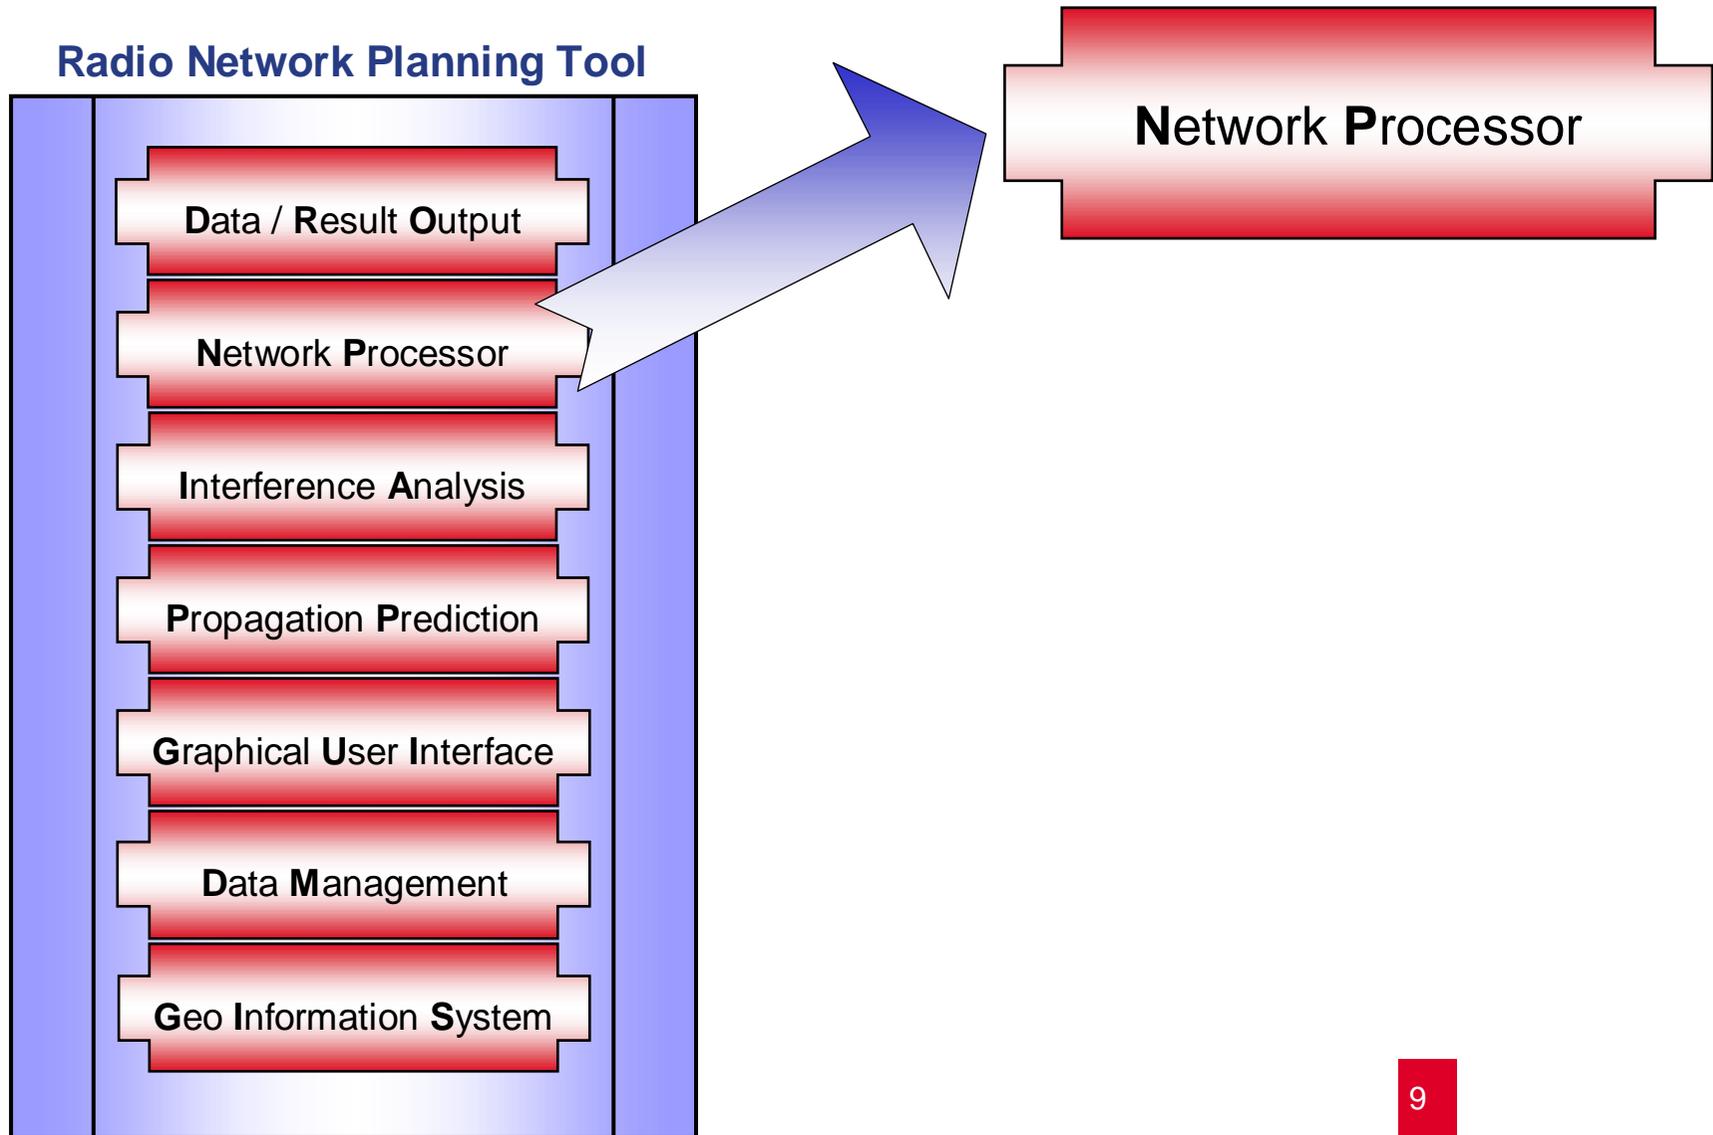

- ➔ ***This function is used to find out gaps in the frequency spectrum where new TV or FM transmitters could be planned. At a desired transmitter site (transmitter coordinate) a wanted transmitter calculation based on a frequency range given by the user is done and the usable field strength calculated for each frequency point.***

The Network Processor

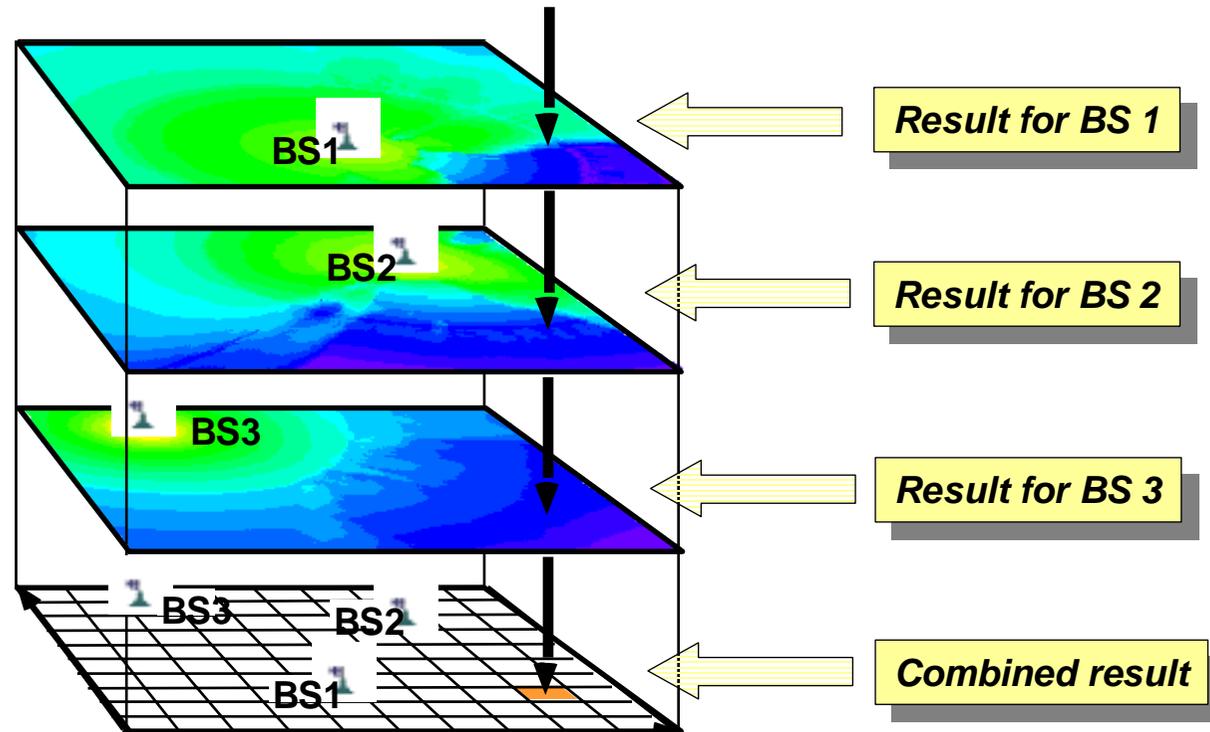

- produces network-wide results out of the single-cell-based results
- allows to analyse the radio network
- allows to simulate changes of the network parameter
- allows to simulate changes of the network design
- allows to optimise the radio network
- allows to plan the future roll-out phases
- produces statistics on the selected results

Each Service needs an own service-specific Network Processor

Network Processor

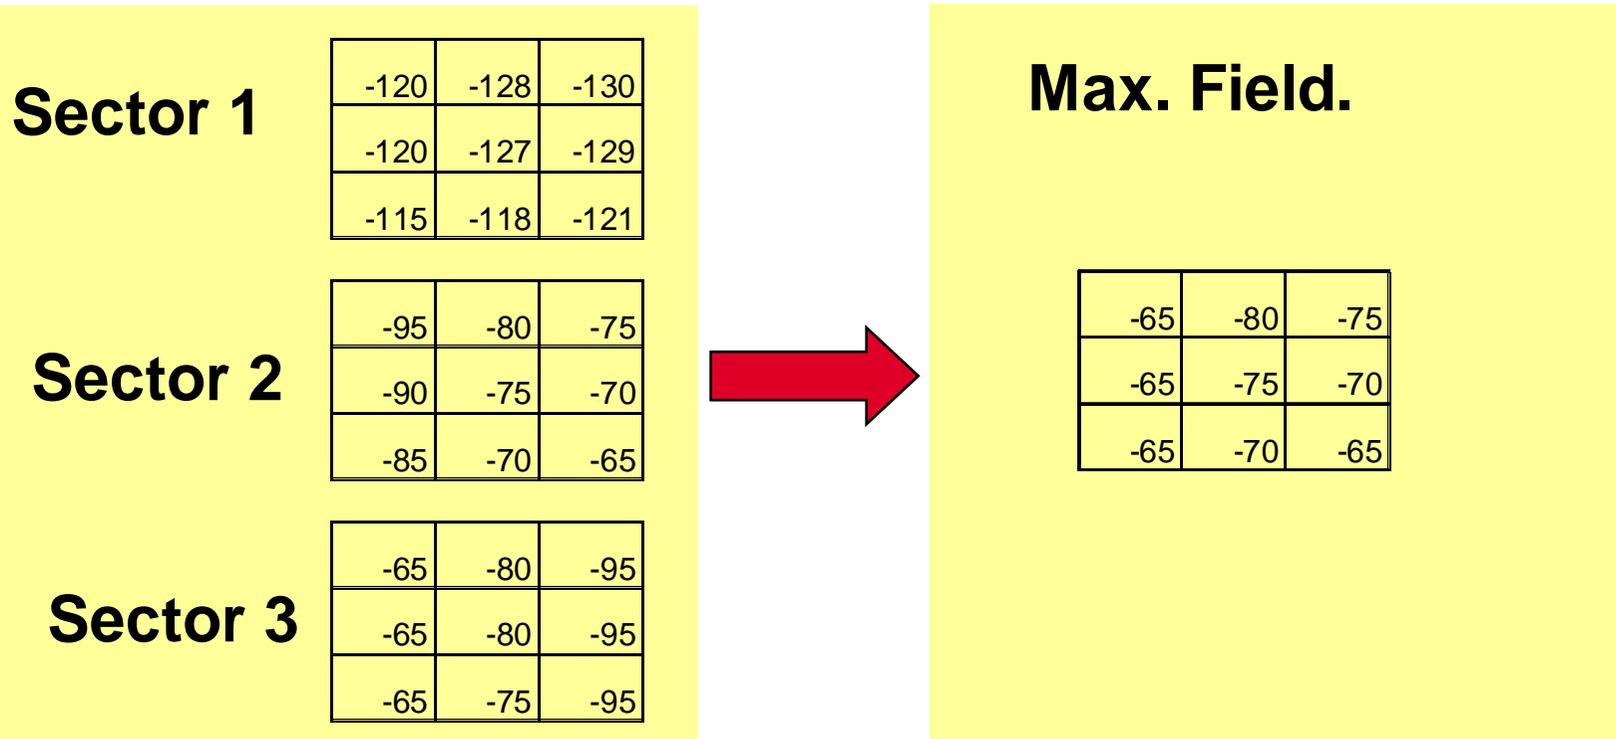

Principle of calculation: Combination of different results

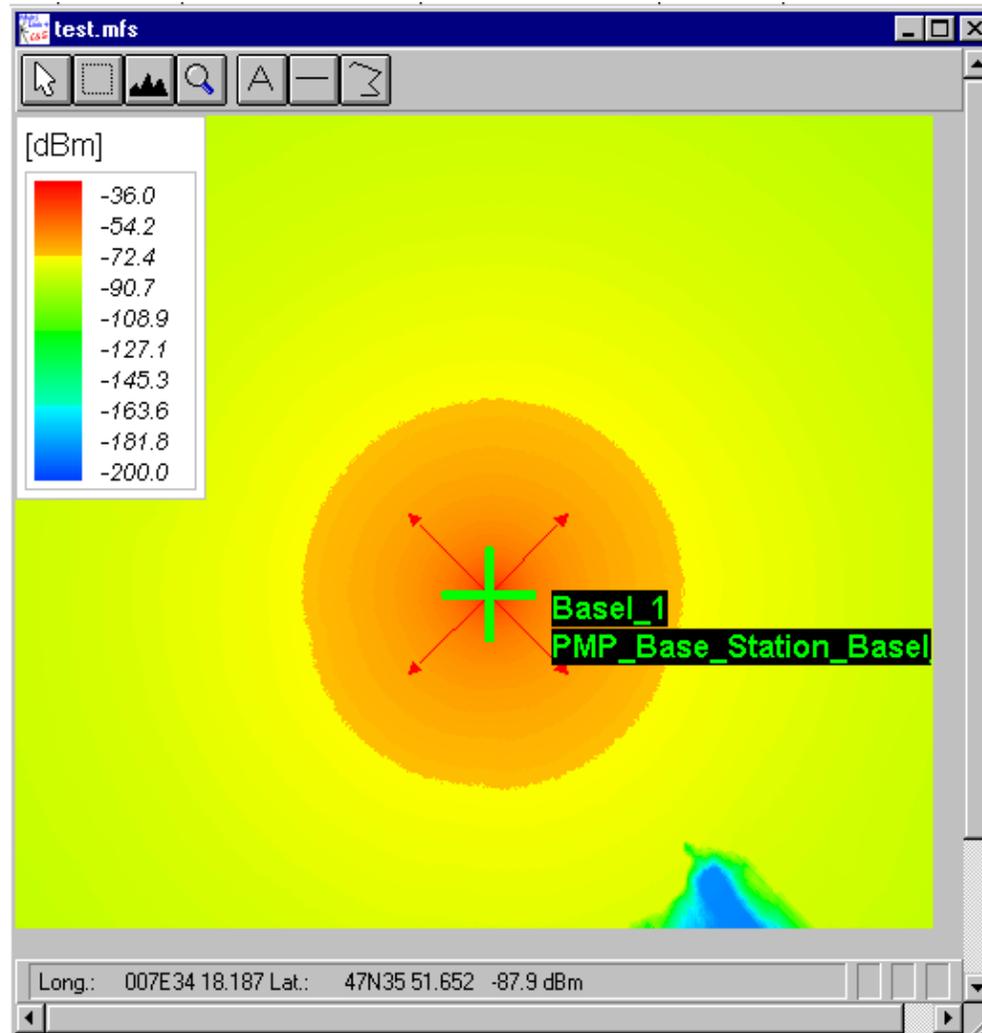

Maximum Field Strength:

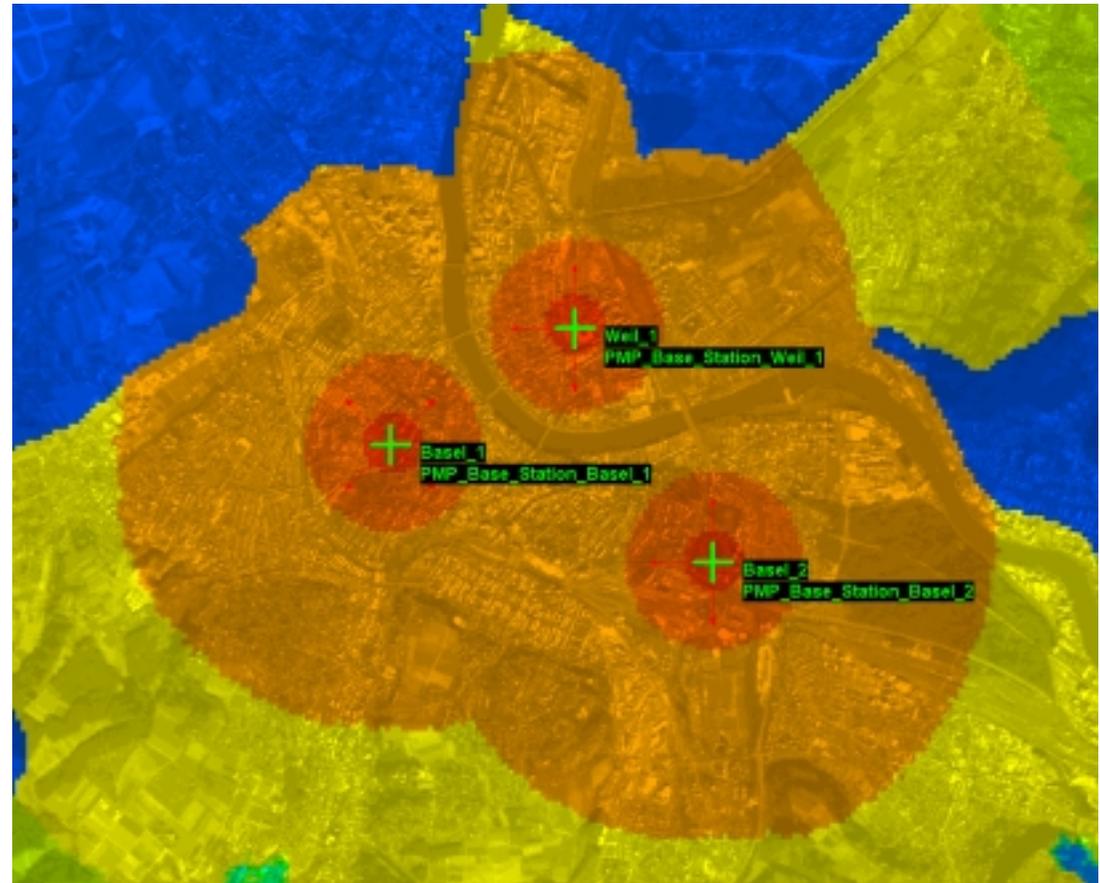

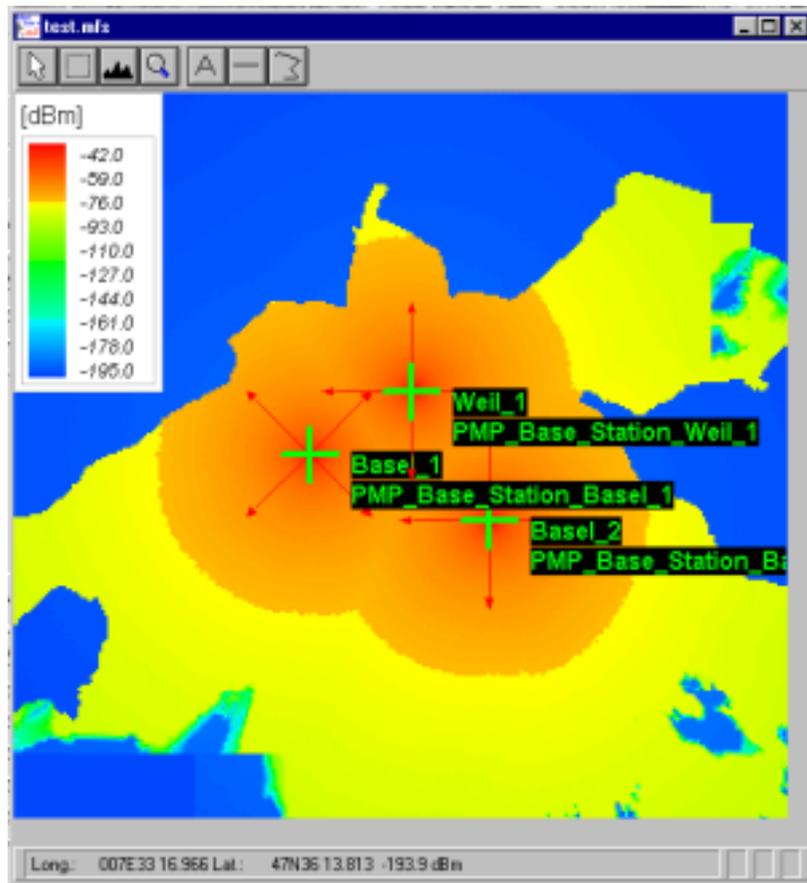

For every pixel, this plot shows the signal level of the cell/transmitter producing the maximum single field strength.

Network Processor

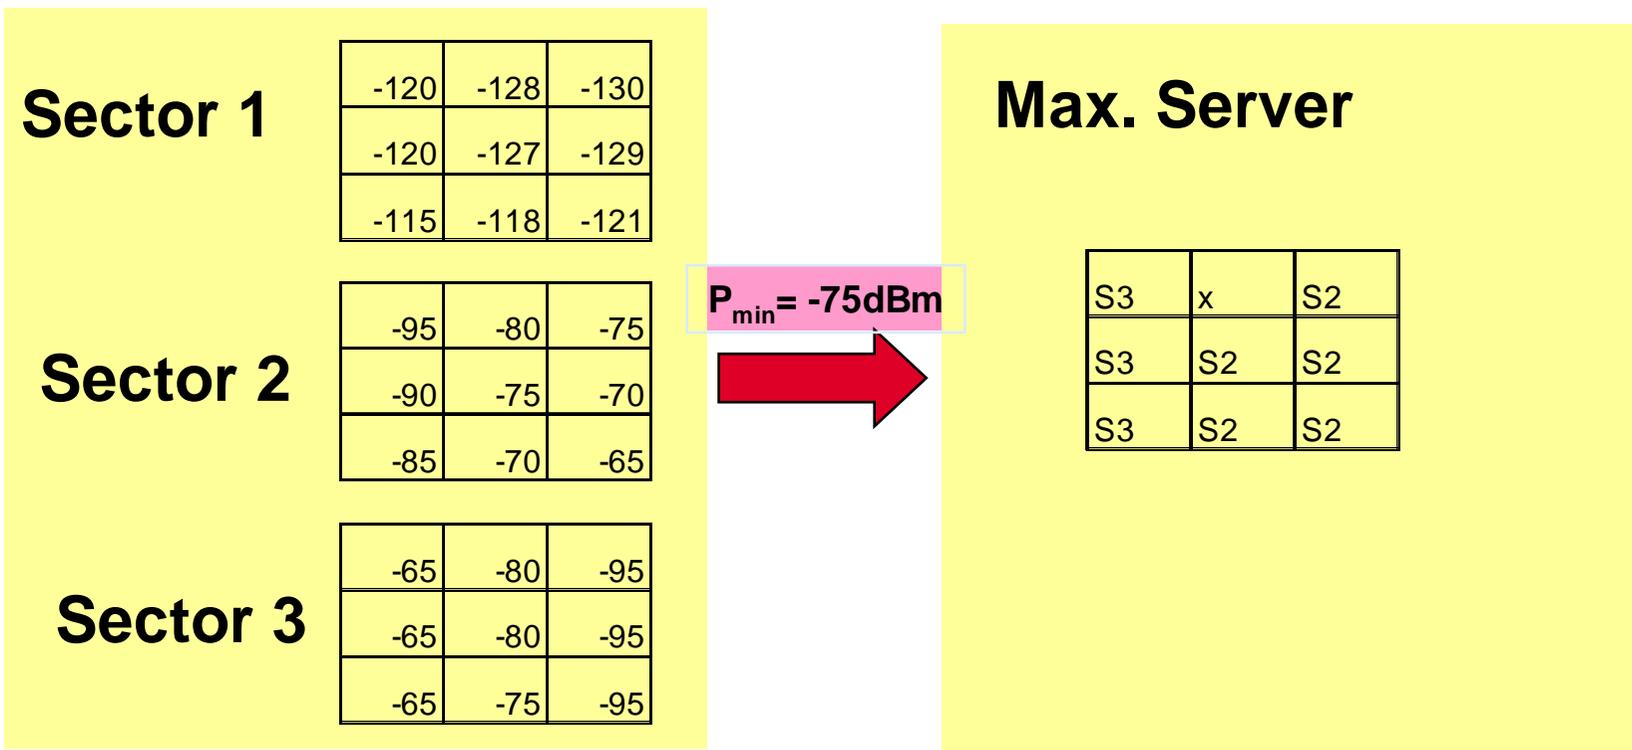

Network Processor

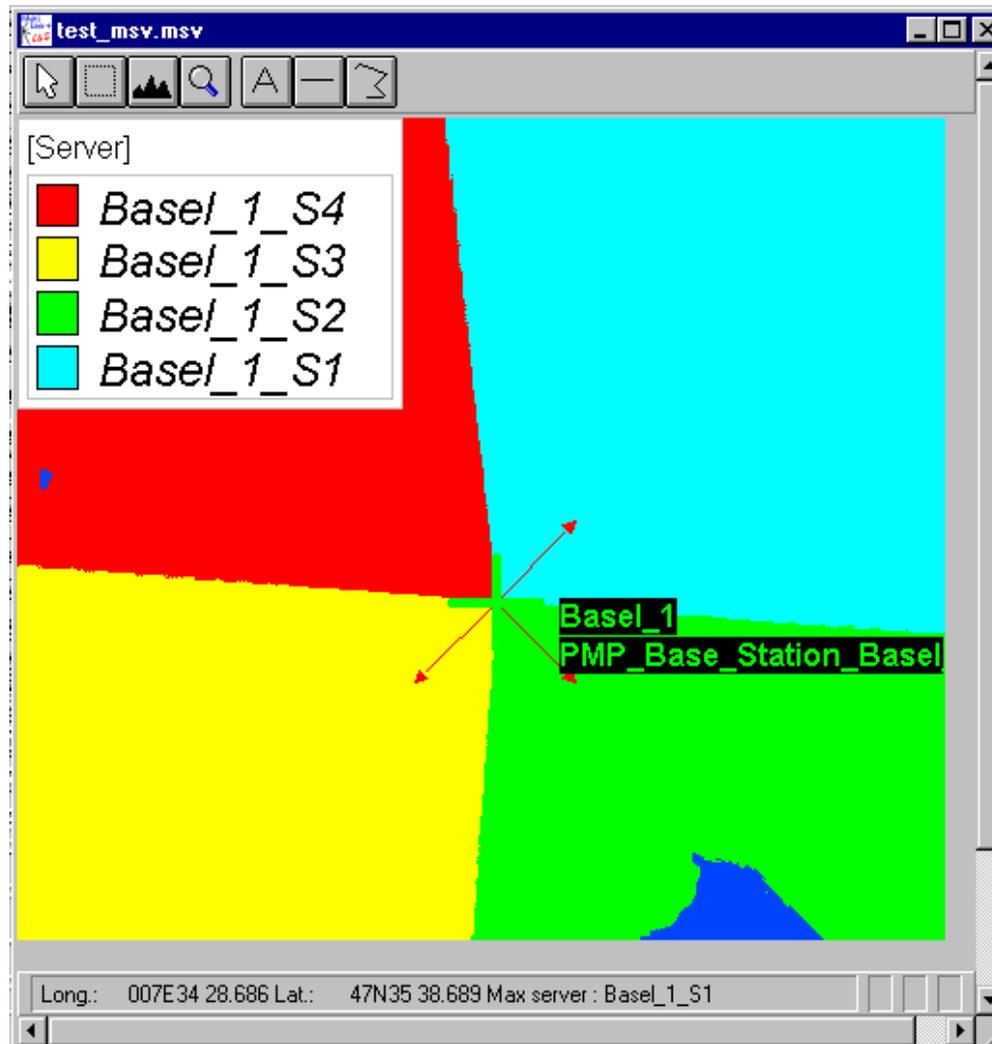

Maximum Server:

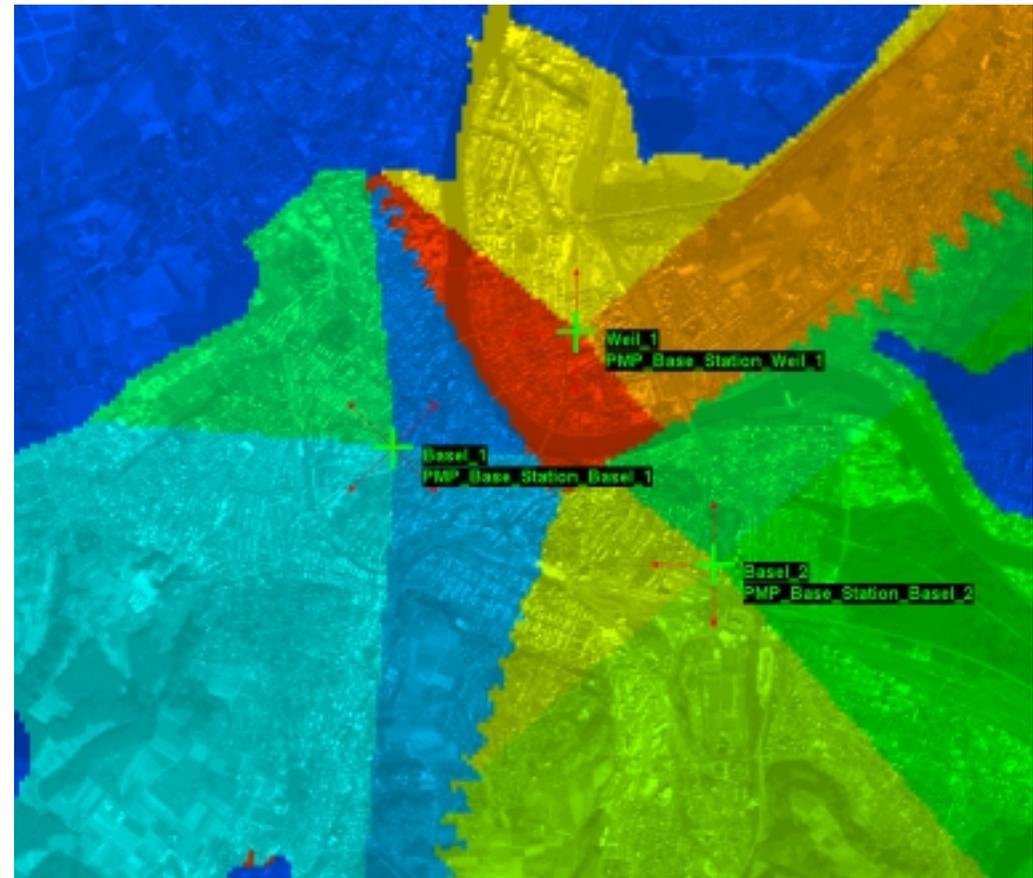

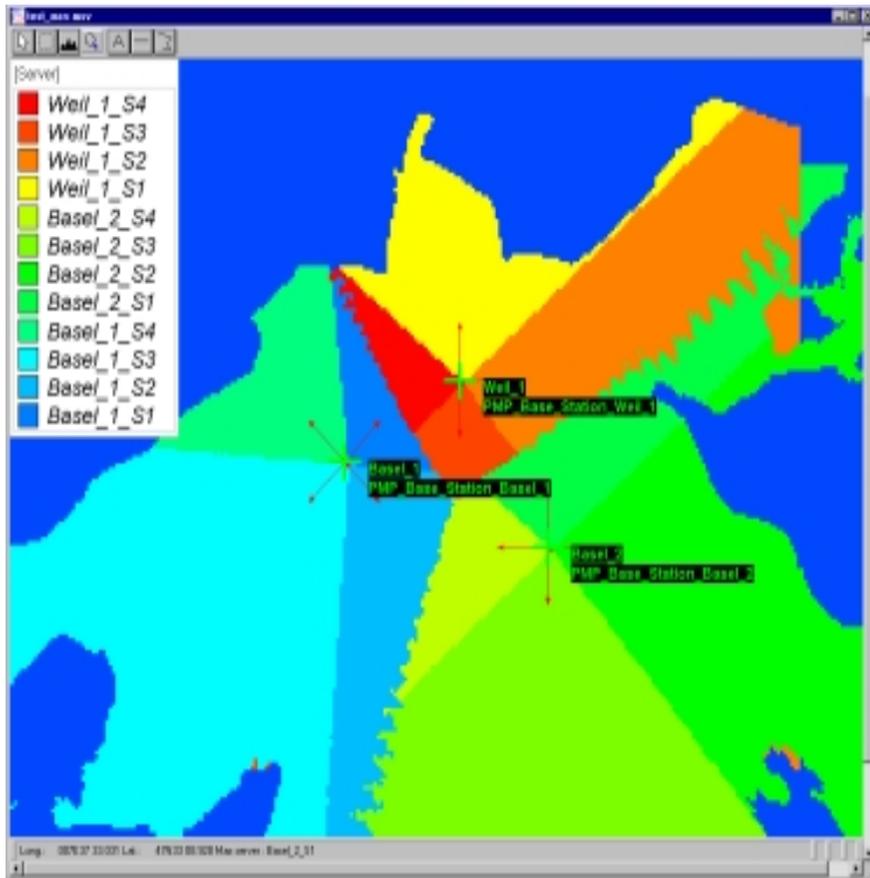

The maximum server plot shows, for a certain pixel, the name of the transmitter featuring the maximum signal; its field strength must exceed the minimum field strength required for coverage, $E_{\min \text{ equiv}}$.

Network Processor

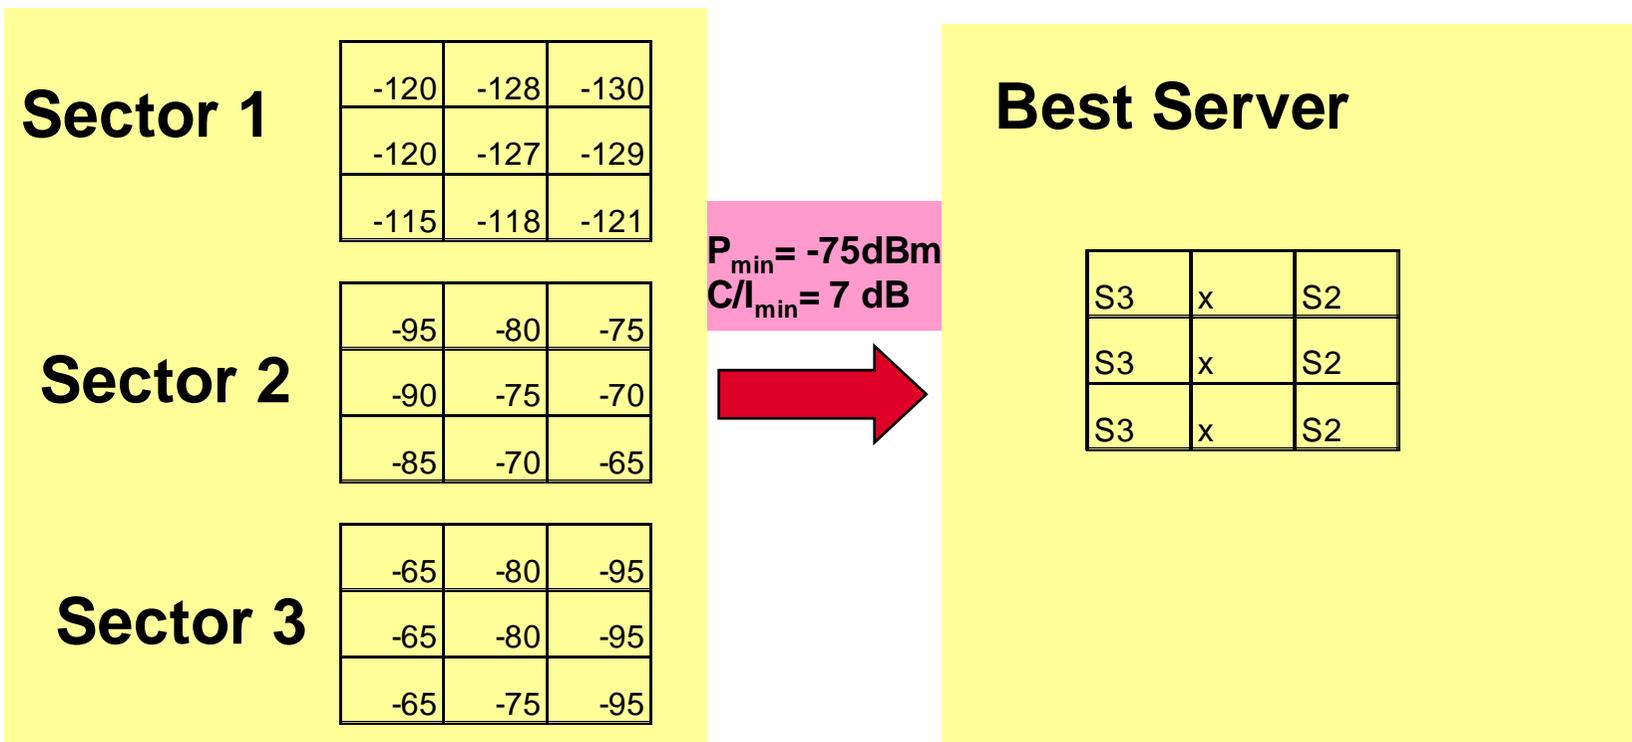

Network Processor

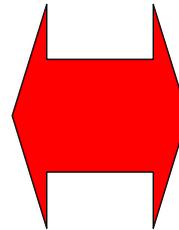

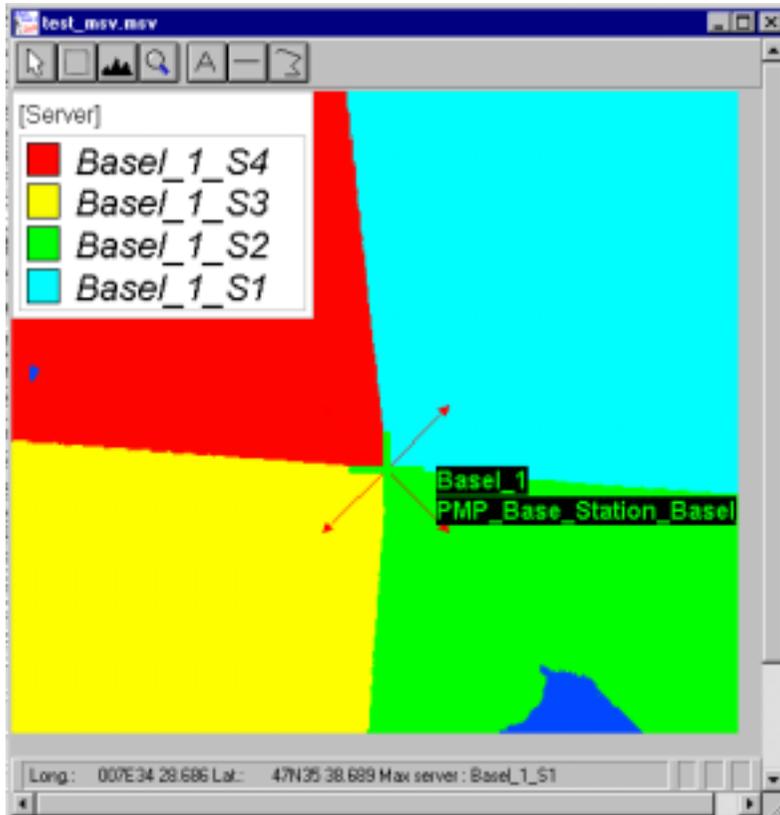

Best Server:

The maximum server plot shows, for a certain pixel, the name of the transmitter featuring the maximum signal; its field strength must exceed the minimum field strength required for coverage, $E_{\min \text{equiv}}$ and the Minimum C/I

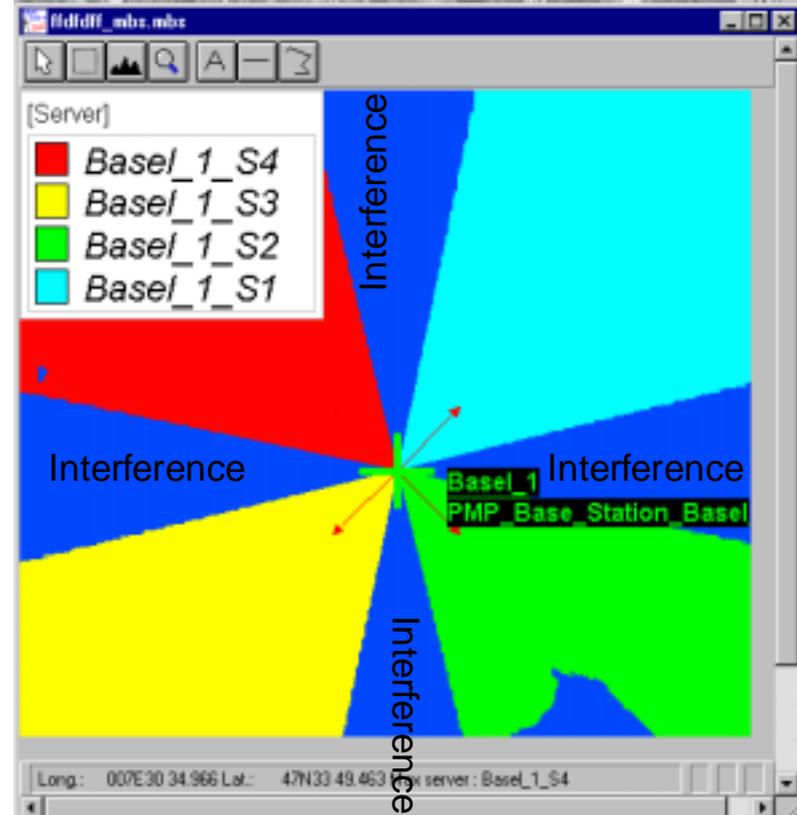

Network Processor

Maximum Server

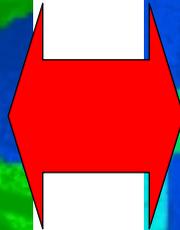

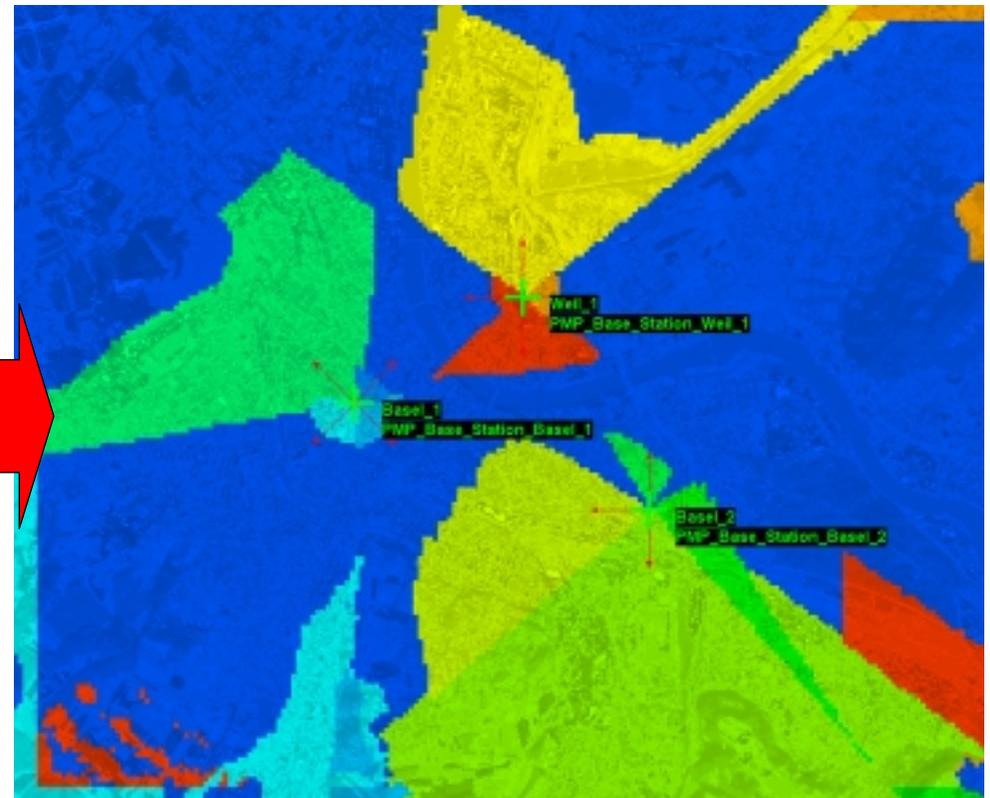

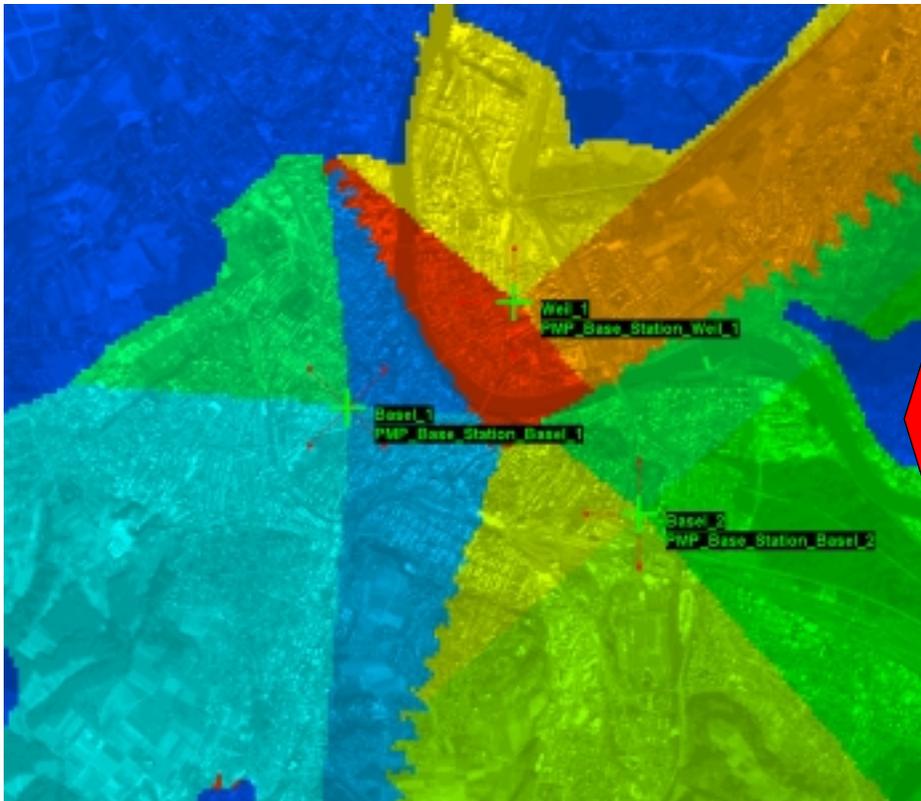

Best Server

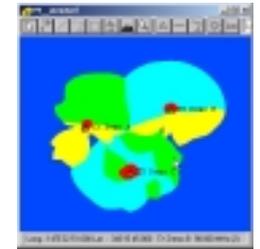

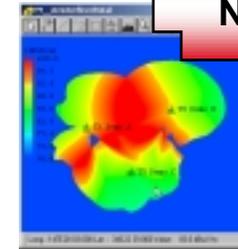

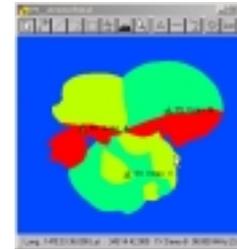

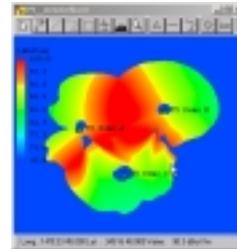

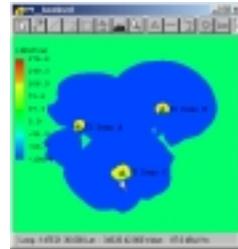

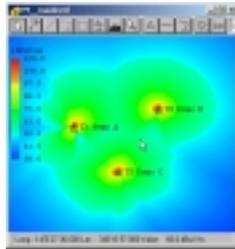

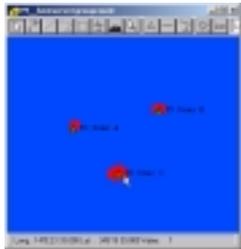

Network Processor

Maximum Server

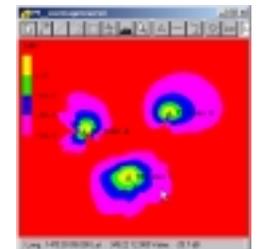

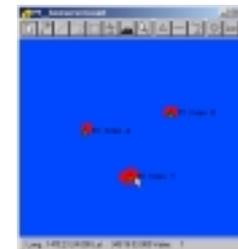

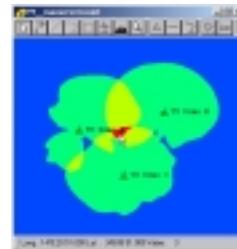

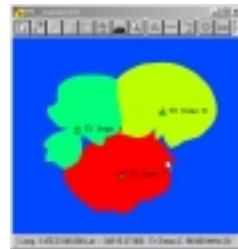

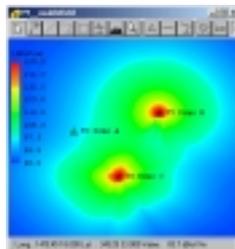

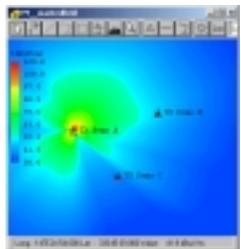

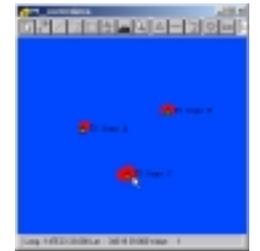

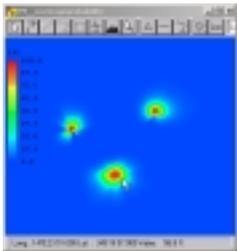

Best Server

 Network Processor

Many other service-specific results can be processed by a powerful Network Processor, like:

- Number of Max Sever
- Number Best Server
- Strongest Interferer
- Level of Strongest Interferer
- Coverage Probability
- Coverage Reserve
- Power Difference
- Assignment Probability
- Handover Zone
- Required Channels
- Coding Scheme Area (GPRS)
- SFN Level Gain
- ...

Automissed Frequency / Channel Assignment

Interference Analysis

Network wide parameter

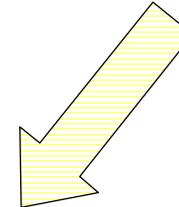

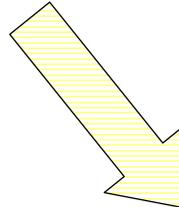

Frequency spectrum

Cell specific parameter

*Number of required carriers
Channel constraints*

Cell relations

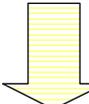

*Neighbour relations
Channel separation matrix*

**Interference Analysis
Interference Matrix**

Allocation algorithm

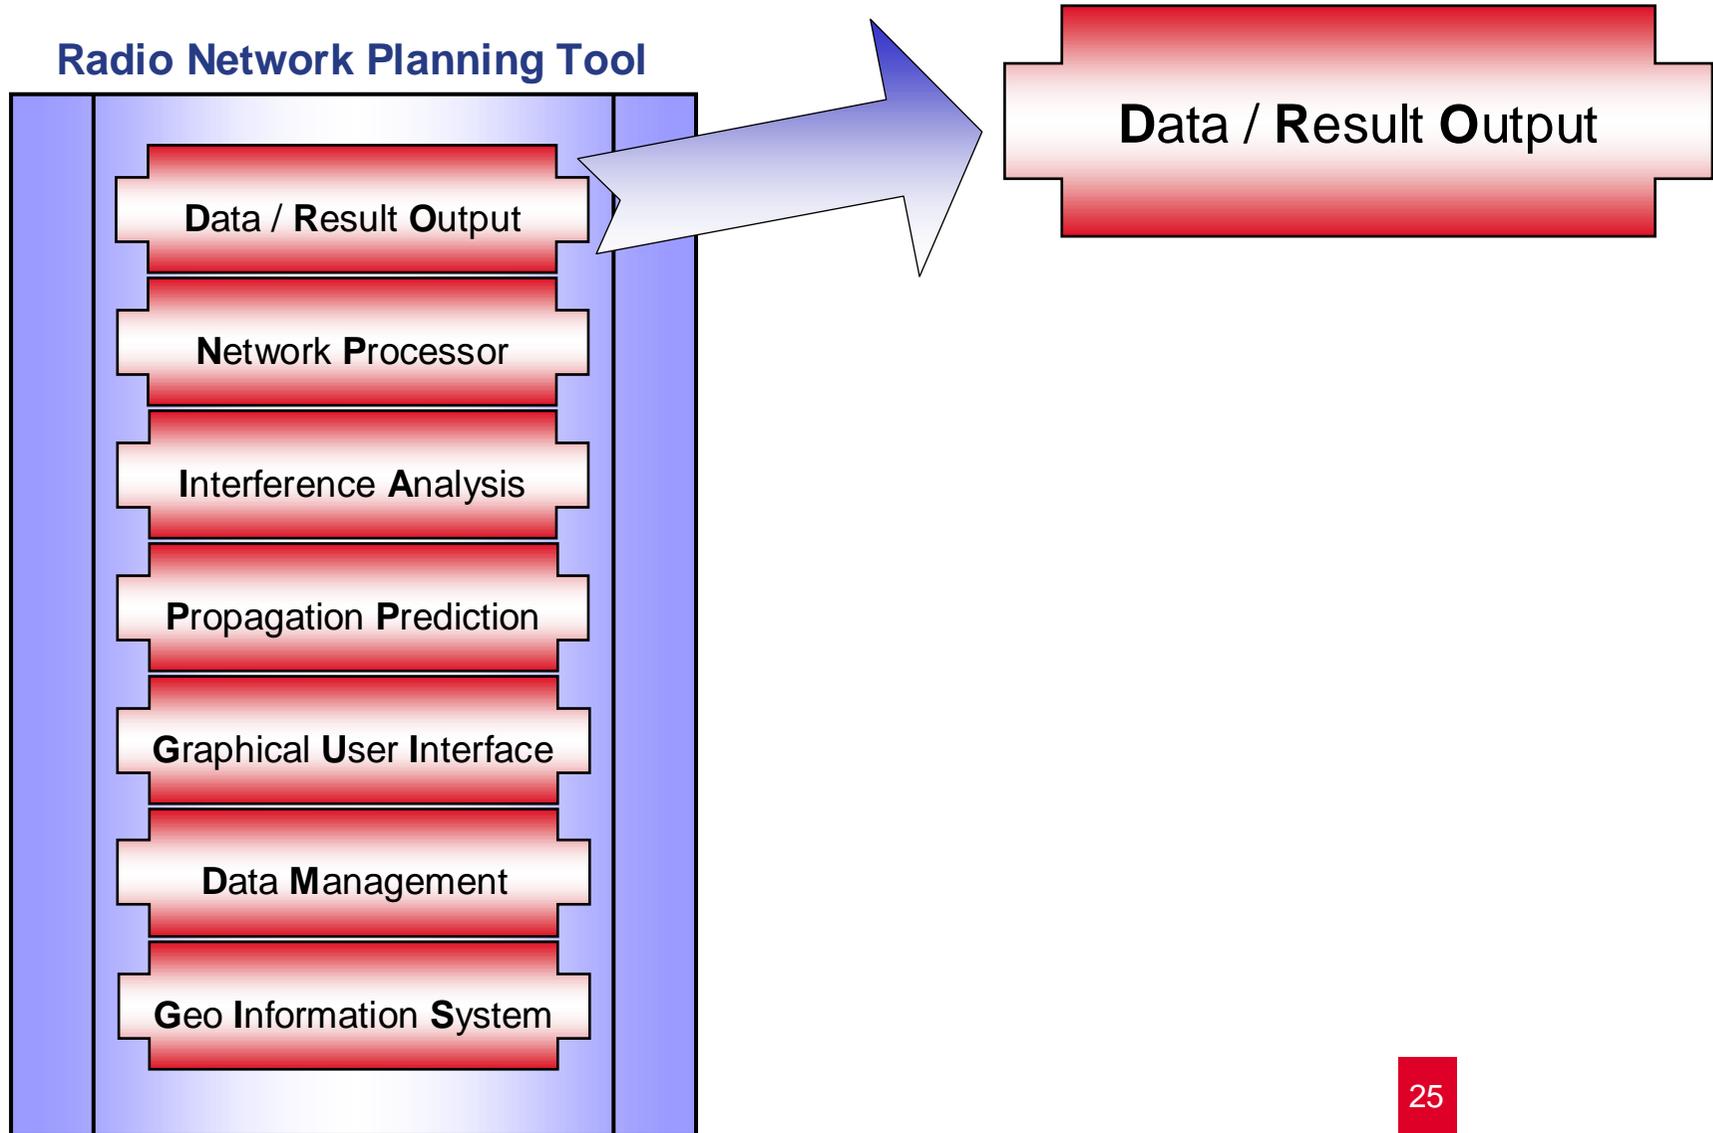

Channel allocation

- LS Box algorithm
- Simulated annealing algorithm

Live Planning Tool Demonstration

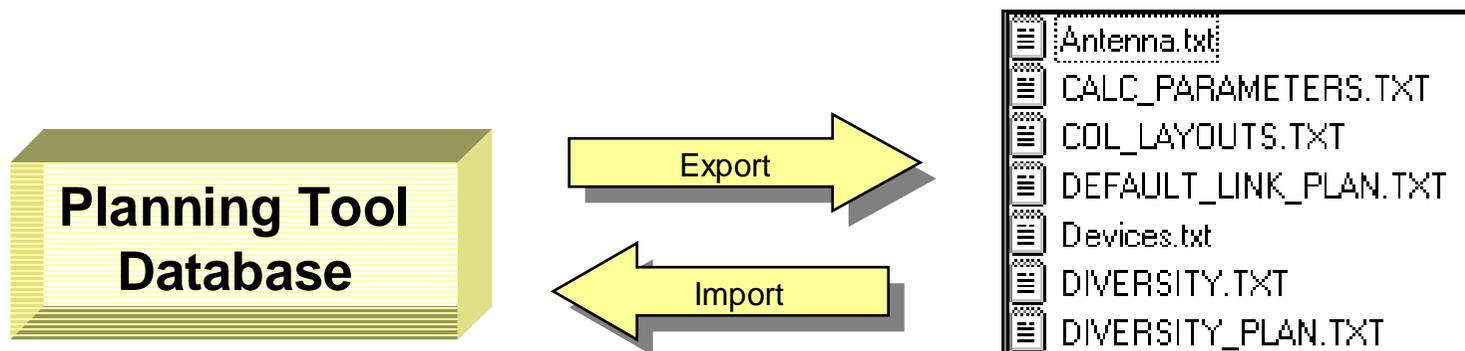

„MULTIlink“
Design Tool for Engineering Microwave Links
and PMP / WLL / LMDS Planning

•Import and Export of

Databases and Tables (Sites, Antennas,...)
Result Files
Measurement Data

Should be possible in several formats (.txt, .xls, ASCII, .jpg, ...)

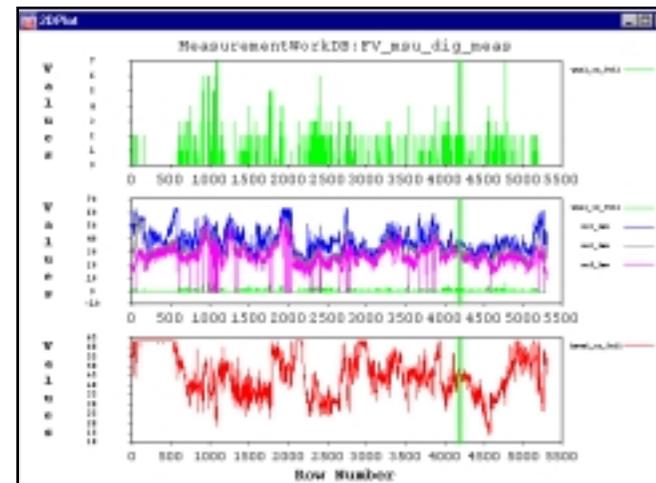

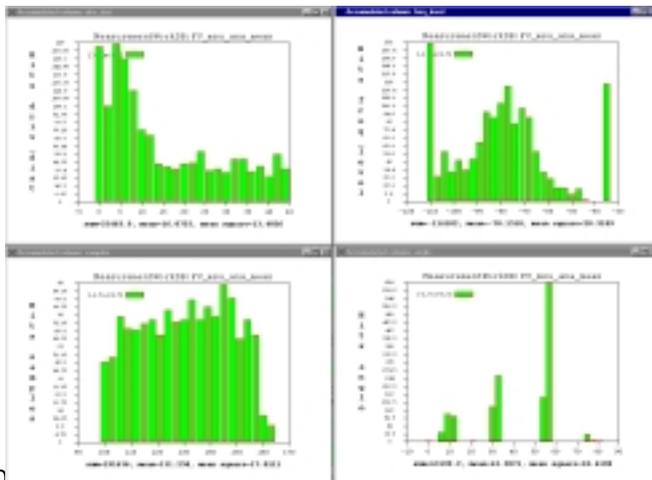

Data / Result Output

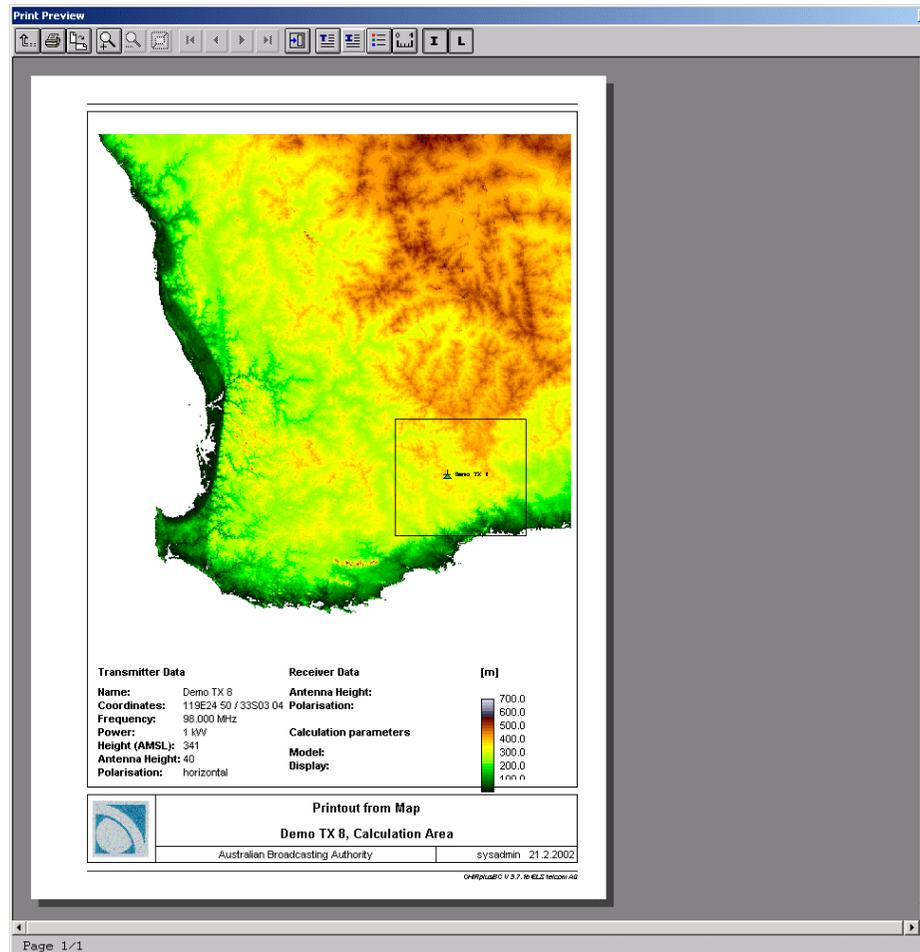

- Import measurement data
 - Analogue
 - Digital
 - BER
- Evaluation of measurement data
 - Rohde&Schwarz,
 - Alcatel, Ericsson TEMS, generic ASCII
- Plotting of measurement data
- Calibration
 - Path loss fit
 - Calibration of extended OH model
