

Presentation 11: Broadband Services based on DVB/RCS Platform over Latin America

Mr. Ruben Levcovitz, International Sales Director, Hispamar.

Hispamar operates a Broadband Satellite Platform from Rio de Janeiro, Brazil. The platform is based on a DVB RCS Standard and provides Internet Access and Multimedia Services over the entire country using Ku Band at its own satellite Amazonas. The platform permits a large set of broadband applications over a very cost effective terminal using small dish and a very simple installation and activation procedure. Hispamar also provide broadband service from a DVB RCS platform operating at Spain and using the Hispasat H1D satellite. This second platform services the Latin America countries. The usage of this cost effective solution has been able to support Internet Universal Access Programs over the entire region. The presentation will introduce the platform, the satellite coverage and will describe a few case studies.
