

2.1.1: BWA: Standards, Regulatory and Spectrum issues

Spectrum management is a complex process with long time constants. This presentation examines considerations in spectrum management and the associated process of spectrum allocation in an IMT-2000/3G context. It then looks beyond IMT-2000/3G to examine a number of key elements in allocating and managing spectrum for BWA. The presentation is intended to stimulate thinking about how to approach spectrum allocation, and invites participants to get involved in the process to ensure that their requirements are satisfied by future spectrum allocations and associated standards.
