Refarming 850/900 MHz Outline

- Look at the background to this – where are we with 3G deployment and how we got here
- Discuss the benefits of 850/900 MHz for UMTS
- Benefits to developing economies from more mobile enabled internet access
- Highlight the complexities of allowing this to happen *efficiently*
- What we need to do and when
- GSMA is working on a report on the need increase the awareness for refarming, to help bring forward the timescales

Copyright GSM Association

2

some background

- Now moving from 2nd to 3rd generation
- Core bands 2.1 GHz assigned for IMT2000 by ITU
- 2.1 GHz is good for capacity for new data services
- But coverage is more expensive at 2GHz, than 850/900 MHz
- Operators have relied on GSM850/900 for wide area coverage
- Now operators see the advantages of UMTS900

3

Copyright GSM Association

The parties involved

- Operators – need equipment and regulatory approval to refarm 850/900 MHz
- Vendors – they want markets for their equipment. Uncertainty is bad for business.
- Regulators – they can significantly delay refarming, from when economically efficient
- Consumers and the economy – they are effected by the interplay of the above.
- In developing economies 3G can boost mobile internet take-up

4

Copyright GSM Association

What's to commercial driver

- The best way to deploy 3G is to use 2.1 GHz for high demand area (city centres) - capacity
- Use 900 MHz for rural and low demand areas
- Use 900 MHz for in-building penetration
- During start up might be best to use almost exclusively 900 MHz to provide low capacity coverage – delays capital expenditure
- Makes 3G a much more attractive commercial proposition
- Translates into cheaper service and more investment – consumers and economic efficiency best served

5

The frequency bands

| Band | | Cingular US | Rogers Canada | Telstra Australia |
|------|---------------------|----------------|------------------|----------------------|
| I | UMTS 2100 | | | X |
| II | UMTS1900 | X | X | |
| IV | UMTS 1.7/2.1 GHz | | | |
| V | UMTS 850 | X | X | X |
| VI | UMTS 800 | | | |
| VIII | UMTS 900 | | | X |
| IX | UMTS1700 | | | |

Source Ovum – UMTS 850: Implications for Telstra

6

Copyright GSM Association

What's the problem

- Operators won't deploy base stations until they have competitively priced kit – especially handsets
- Can take years to plan
- Need big economies of scale to achieve this
- Vendors won't commit to large production runs until they have or expect orders
- No one wants to commit until regulators give a date
- Delays refarming 850/900 MHz from when it is economically efficient to do so.

7

Copyright GSM Association

What's the solution

- All parties need to move forward together – operators, vendors, regulators
- This allows the required long term planning and economies of scale in handsets
- Allows consumers and economies to benefit from mobile broadband

8

Copyright GSM Association

What's the issue

Helping to boost the availability of IMT2000 in developing and developed markets. This is good for consumers, competition, and economic growth. There is a strong link between mobile penetration and economic growth.

To do this requires that we give IMT2000 every chance to flourish, and that the regulatory regime does not harm this.

This requires that spectrum in bands below 2 GHz, be made available to IMT2000 operators. In particular "mobile friendly" bands such as 900 and 850 MHz (GSM).

This will reduce costs and improve coverage, which will boost market penetration.

Statistics

- Global GSM & 3GSM mobile connections outstrip rivals:
 - 29% of the global population
 - 82% of the global mobile market
- 1000 new connections every minute
- Close to 2 billion GSM connections
- 71 million 3GSM/WCDMA subscribers*
- 3GSM/WCDMA is available on 105 networks in 47 countries
- 315 GSM/WCDMA terminal devices have been launched

Sources: Wireless Intelligence & GSA
* As of 22nd May 2006

11

More Mobile Than Fixed Subscribers

Source: ITU, Wireless Intelligence

- In 2002, mobiles exceeded fixed lines
- In 2006, twice as many mobile lines as fixed
- There are more mobiles in the *developing world* than in the *developed world*
- About 30% of the world's population are mobile subscribers though 80% have network coverage

Detailed analysis

14

Copyright GSM Association

How an operator might deploy – coordinated deployment

2.8 MHz carrier separation for uncoordinated macro Cells in rural and suburban areas, and 2.6 MHz in coordinated areas. Source draft ECC report 82.

Benefits of 900/850 MHz

- Reduce deployment costs
- Increase mobile penetration
- Leads to greater economic growth from more internet use
- Encourage foreign investment
- Increase attractiveness of wireless local loop / HSPA for greater fixed internet penetration
- Can reduce environmental impact by having fewer sites.

Impact of frequency on deployment costs

Sites required to cover 10,000 km²

| Frequency band | voice | 64 kbps | 64/384 kbps |
|----------------|-----------|-----------|-------------|
| 2 GHz | 454 sites | 887 sites | 1980 sites |
| 1 GHz | 174 sites | 340 sites | 665 sites |
| % reduction | 61.7% | 61.7% | 66.4% |

Source UMTS Forum report 38

Copyright GSM Association

17

Top level Impact on the business model

- Assume 50% are coverage limited, 50% capacity limited
- Save 31% saving in cell sites
- If 70% of capex dependent on cell site numbers means **@22% of capex saved**
- And better in-building coverage – major benefit for consumers

Copyright GSM Association

18

Also impacts on timing of spending - cash flows

- Can now deploy “thin” capacity networks to drive market demand initially using 900 MHz, then use 2.1 GHz to add capacity as subscriber numbers increase.
- Delays capital expenditure, save \$millions on interest payments
- Makes the business plan much more attractive
- This will encourage operators to deploy 3G more rapidly

19

Copyright GSM Association

Illustration of savings

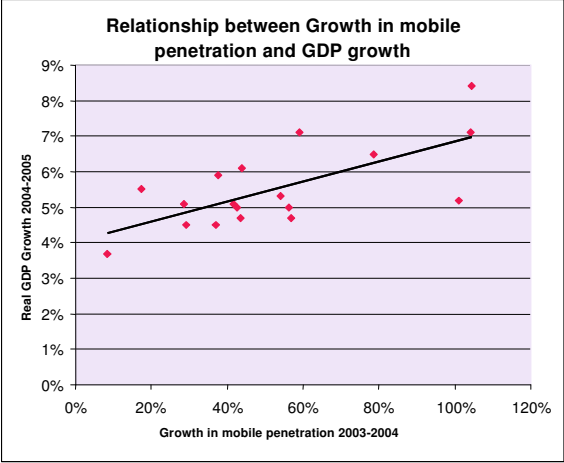

- Operator A needs to cover 10,000 km²
- Needs @2000 sites at 2.1 GHz
- Using 900 MHz initially needs only 700 sites.
- But with only 2 x 5 MHz at 900 MHz, capacity is low. Operator needs to build capacity in when there is demand.
- When full capacity network deployed you have 1000 **2 GHz** cells, and 350 **900MHz** cells. Ie 1350 cells overall.

How do developing markets benefit

Source: Ovum - "The Economic and Social Benefits of Mobile Services in Bangladesh" For GSMA April 06.

Impact on GDP and FDI

- In developing countries, for every additional 10 percentage points of mobile penetration, the annual GDP growth rate is increased by approximately 0.6%.
- Higher mobile penetration will assist Foreign Direct Investment (FDI), e.g. a 1% increase in mobile penetration is associated with a 0.5% to 0.6% increase in FDI as a proportion of GDP.

The benefits of 3G service

- There is a strong link between mobile penetration and economic growth in developing economies.
- Strong link between internet penetration and economic growth for developed economies – could apply to developing markets?
- Use of internet to reduce business costs and boost productivity. Remote working, working on the move. Use of internet to allow better markets for goods and services.

23

Copyright GSM Association

The benefits of 3G service continued

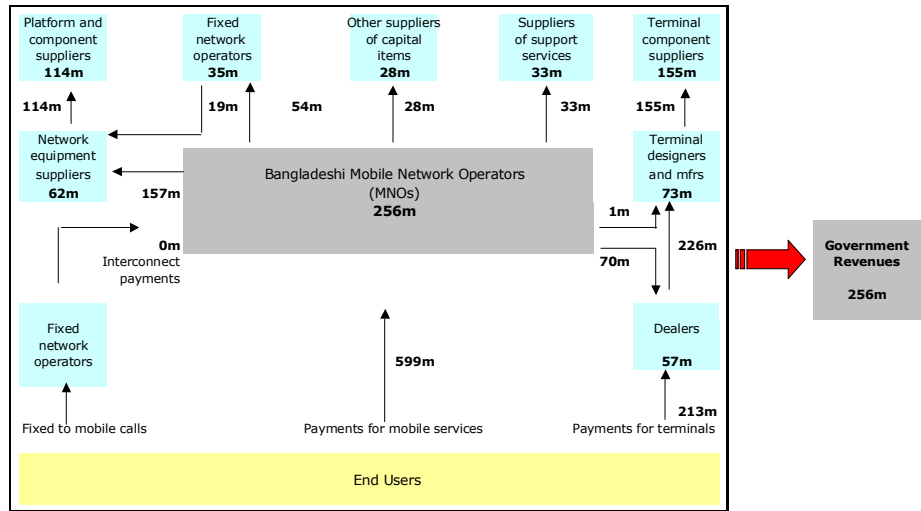

- Small business can market themselves with web sites and consumers can access them
- With a mobile phone your in business, with a 3G phone your on top of business
- Farmers can check the spot price for their goods more easily with internet
- Internet gives a qualitative boost for developed economies – can do the same for developing ones too
- But requires that lots of people have them for maximum effect – network effects

Copyright GSM Association

25

Challenges posed

- Potentially lose 50%+ of GSM capacity, depending on how much spectrum an operator has
- This requires that in capacity limited areas 50% of users are dual mode – ie GSM/UMTS-900
- Takes time to “seed” markets to allow uptake of dual mode handsets
- The more expensive UMTS900 is the more handset subsidy is required. This will likely increase the time required to build UMTS900 penetration

Copyright GSM Association

26

Handsets

- Key issue to making this happen
- Need to be available at low cost for all market segments
- Needs time for vendors to make them available in sufficient quantities to benefit from economies of scale.
- Economies of scale requires regulatory certainty about when refarming 850/900 allowed.
- Takes time to develop new handsets, modify handset production facilities, test and type approve. A year, 18 months?
- No major technical problem.

27

Copyright GSM Association

Benefits of economies of scale on GSM

Average sales price (ASP) of low-end GSM handsets and their silicon chip components 1995-2007 (Arete)

28

Copyright GSM Association

Regulatory uncertainty

- Erratic regulation in developing countries has put a brake on telecom investment increasing the cost of capital
- Best practice regulation in Sub-Saharan Africa would have generated:
 - An increase in investment of 25%, nearly \$5 billion
 - A 30% increase in mobile penetration, from 83 to 108 million
 - Additional regional annual GDP of \$1 billion

Source: PwC, London Business School, Wireless Intelligence and GSMA data and analysis

29

Copyright GSM Association

Conclusions

- Refarming 850/900 MHz good for businesses and consumers
- Good for economic growth and efficiency
- Investments have long lead times and need regulatory certainty
- Regulators must act now to resolve this uncertainty, or risk harming consumers economic growth
