Title: IMT-2000 networks delivering BWA

Abstract: IMT -2000 networks have been deployed worldwide for voice and broadband data access. These networks are enabling high-speed Internet access to communities which did not have any means of data communication, and improving their quality of life. The talk will address the various IMT-2000 BWA schemes, the applications and usage enabled by the technology, and then finally touch on the unique benefits the technology has brought to various under-served areas around the world.
