PRESENTATION PROPOSAL

RDF Session #6: Future trends / techniques in spectrum management

Presentation title:
Spectrum management for the future

Abstract:
The presentation would present a vision for future "good practice" spectrum management organization. The material will be essentially a digest of recommendations provided in such ITU sources as the Handbook on National Spectrum Management (Annex 2), Global Symposium for Regulators' recommendations as well as ICT Regulation Toolkit. However the overall content and wording of these recommendations will be structured and formulated with a view on making them as relevant to administrations of Arab/African region as possible on the short term scale.

The following "good practice" areas of spectrum management will be addressed:
- efficient running of spectrum management organisation,
- improving efficiency of managed spectrum,
- promoting transparency,
- embracing technological neutrality,
- adopting measures allowing flexible use of spectrum,
- making spectrum available on timely basis,
- international and regional harmonisation,
- facilitation of innovative technologies,
- making spectrum affordable,
- ensuring level playing field for all interested parties.

For each of these areas a particular set of "good practices" will be given with the guidelines for their implementation in real life situations.
