

Session 5

Placing on the market and spectrum access - Necessary complementary of regulations

In recent years the regulation in Europe for placing on the market of radiocommunication equipment implemented a shift from homologation to declaration of conformity and self-responsibility of manufacturers/importers. With respect to the regulation for the access to the spectrum new paradigms requiring more "technology neutrality" and license-exempt regimes are also in the course of implementation. In this context the Radio Interface Specification (RIS) acquires paramount importance in order to guarantee predictability of spectrum usage regulation both for spectrum management authorities and users.
