ITU-R Standards development on Broadband Wireless Access
(Colin Langtry)

The presentation addresses the development of ITU-R standards on broadband wireless access (BWA) systems for both terrestrial and satellite applications. In each case, details are described of the related BWA standards and key publications, and the status of current ITU-R studies with reference to the relevant groups in which they are conducted. The presentation then continues by describing details of four key satellite publications related to BWA, with particular focus on Recommendation ITU-R S.1782 - Possibilities for global broadband Internet access by fixed-satellite service systems.
