# Speech Enhancement Methods for Vehicle Applications

Tim Haulick

TEMIC Speech Dialog Systems

*"The Fully Networked Car, A Workshop on ICT in Vehicles"*  
ITU-T Geneva, 2-4 March 2005

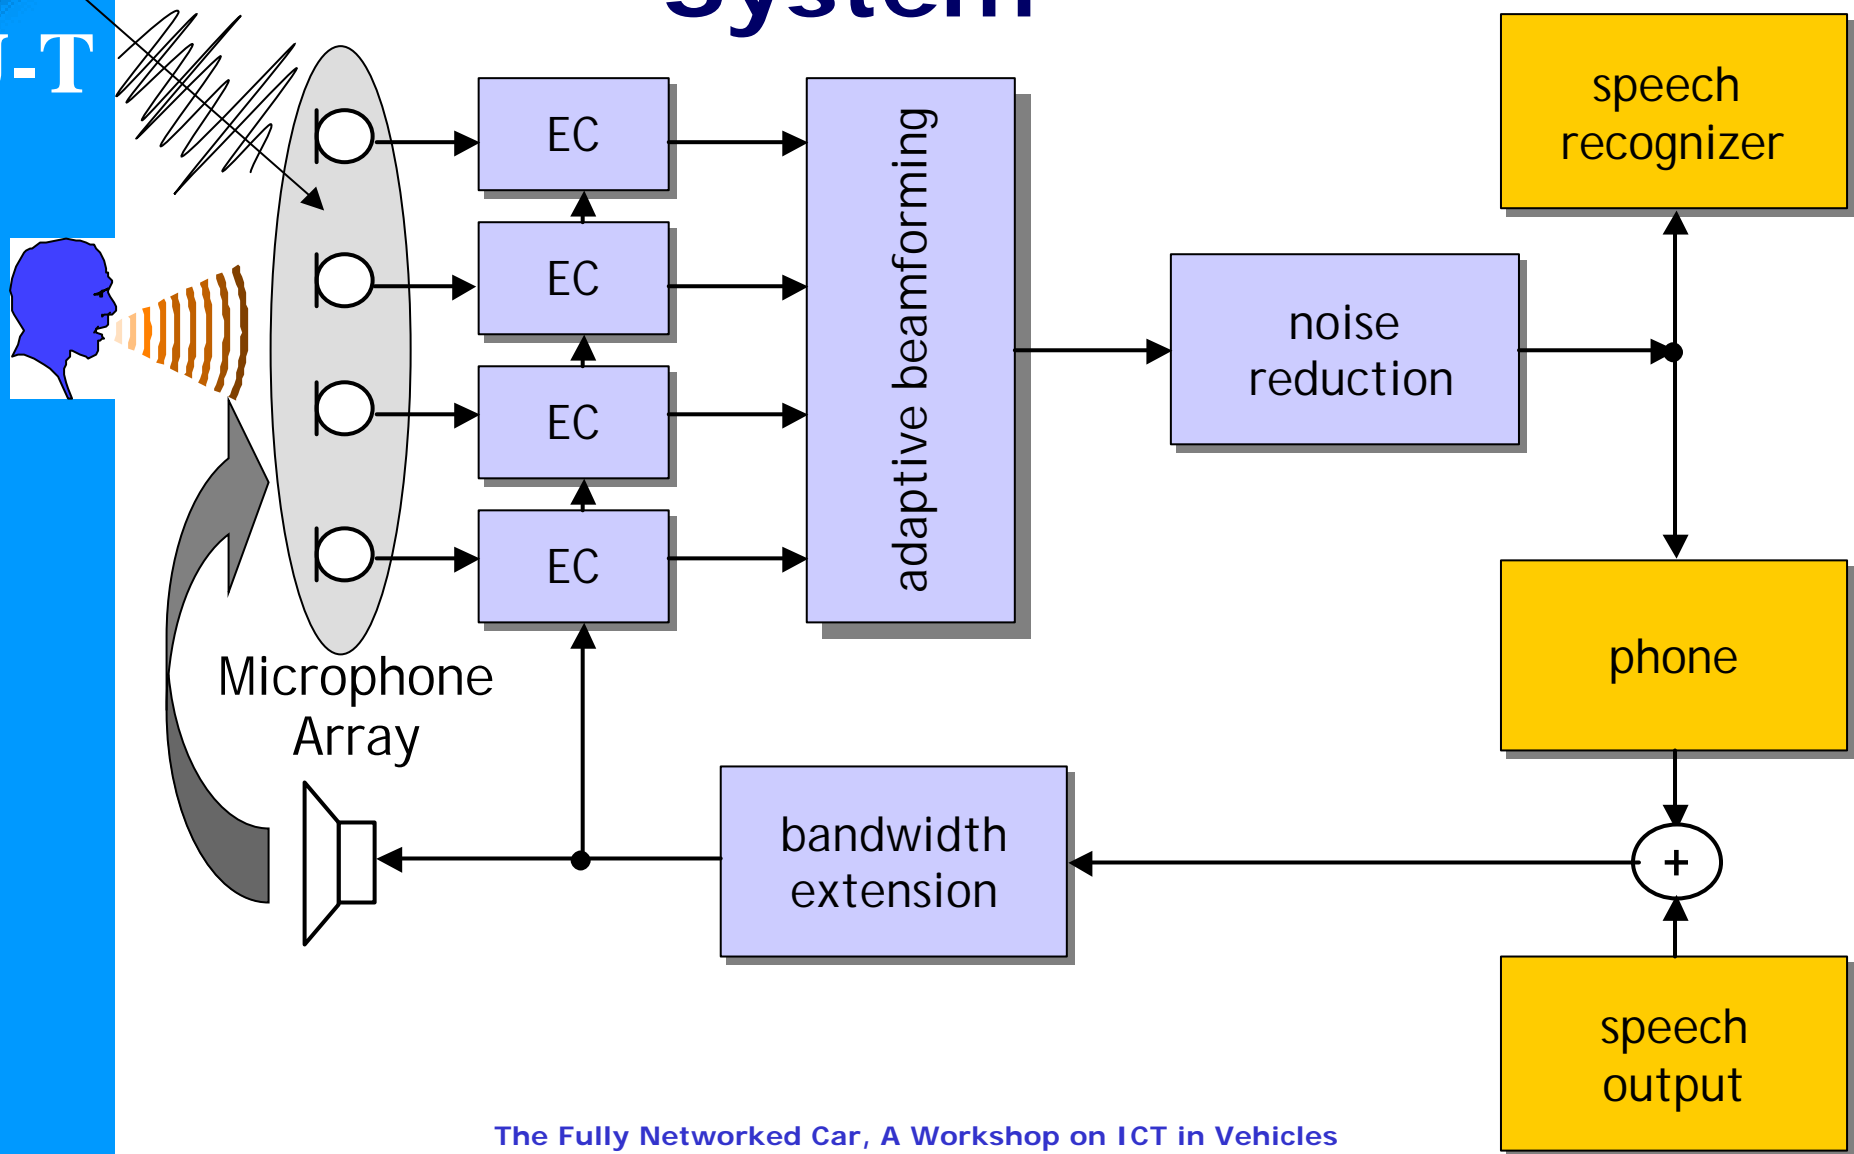

ITU-T

# Contents

- Overview
- Beamforming for vehicle applications
  - Principle
  - Examples
  - Adaptive self calibration
  - Wind-noise suppression
  - Compact dual-microphone array
- Bandwidth Extension
- In-car communication
  - Concept
  - Results of speech quality and intelligibility tests

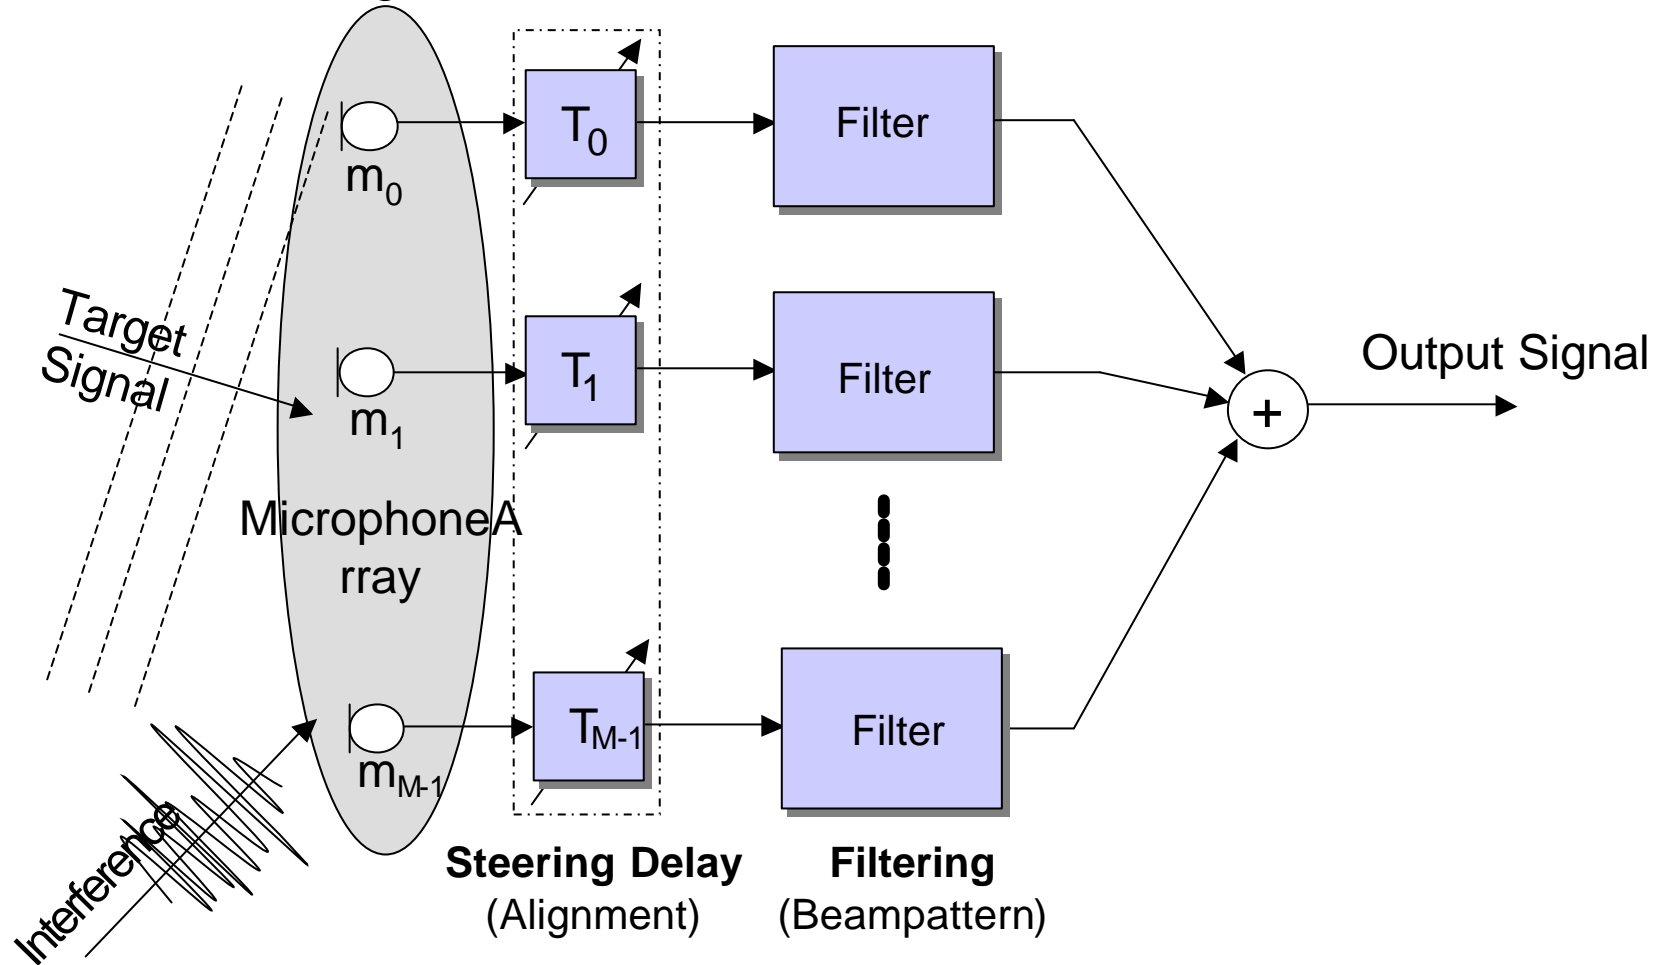

# Integrated Hands-Free System

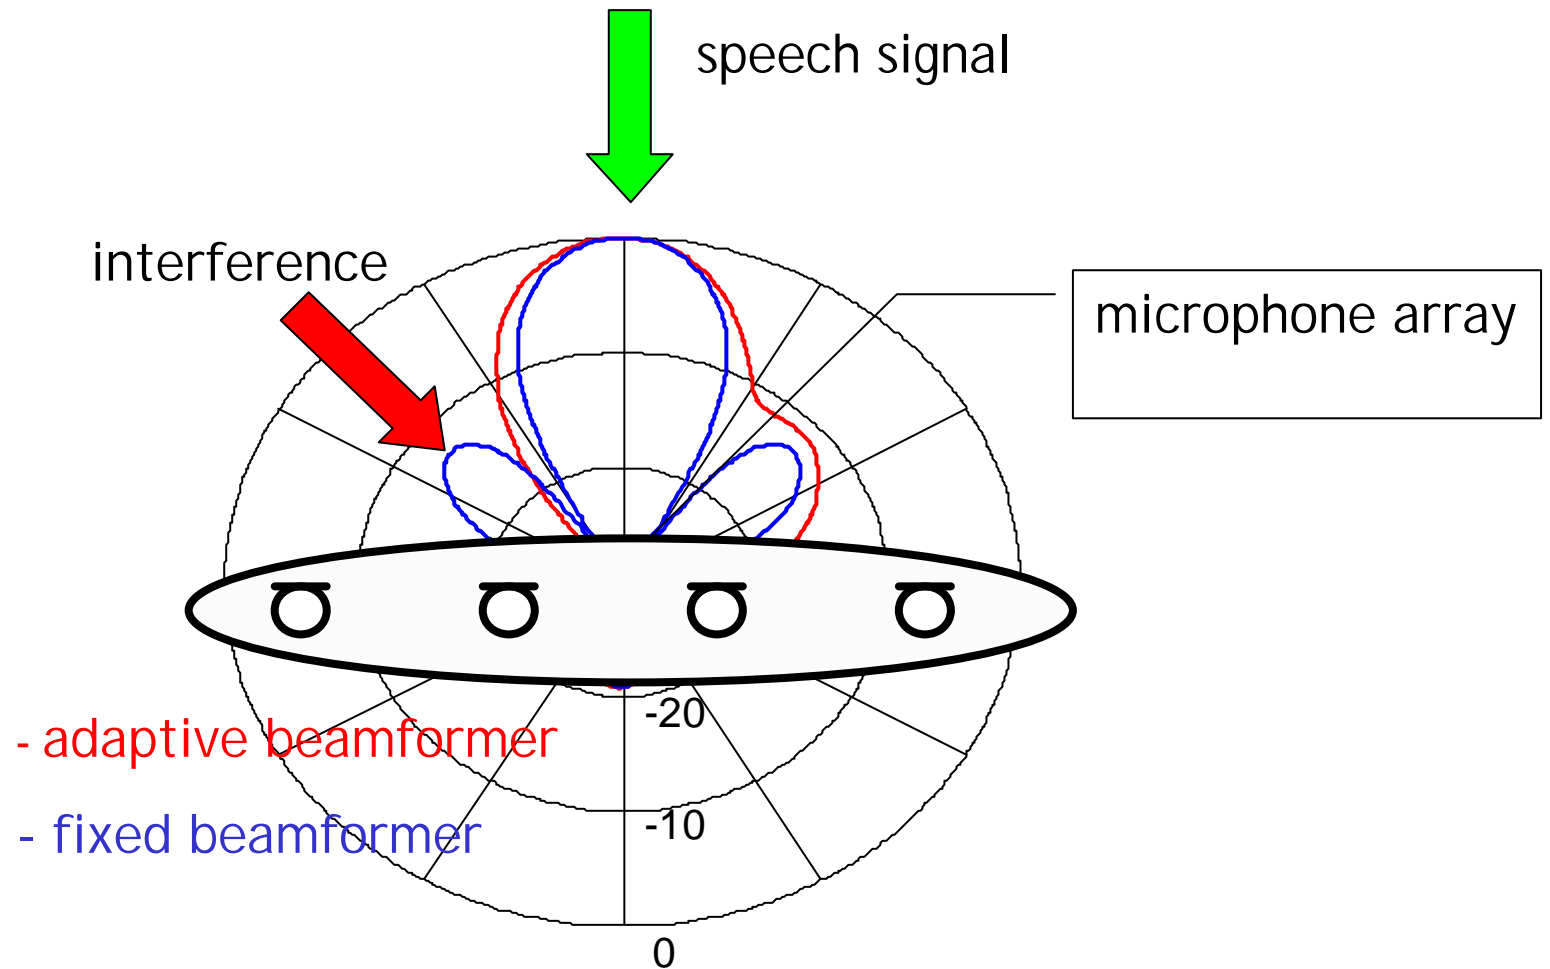

The Fully Networked Car, A Workshop on ICT in Vehicles  
ITU-T Geneva, 2-4 March 2005

# Beamforming

Structure of a generalized beamformer

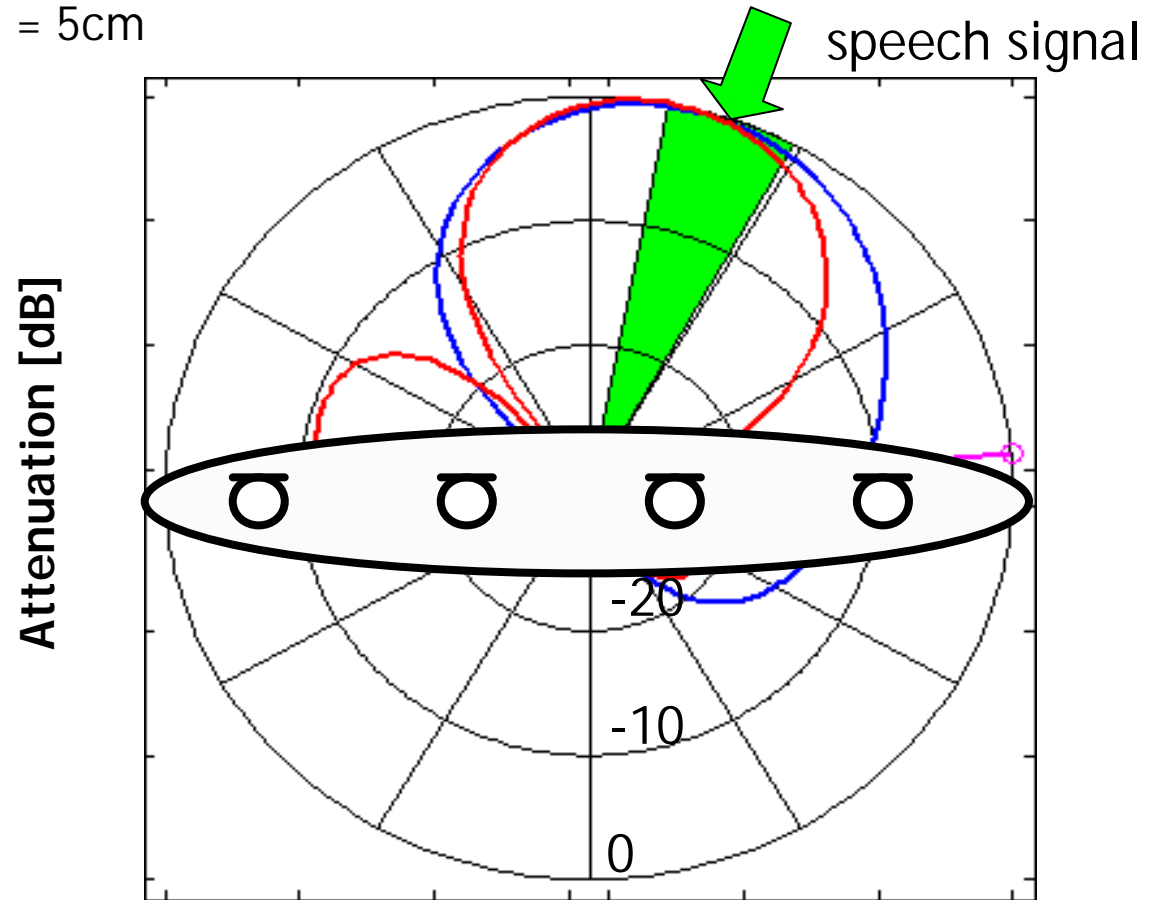

# Beamforming

# Beamforming

Beampattern at 1500Hz for a rotating noise source

4 Microphones,  $d = 5\text{cm}$

blue - fixed  
beamformer

red - adaptive  
beamformer

# Beamforming Microphone Array Integration

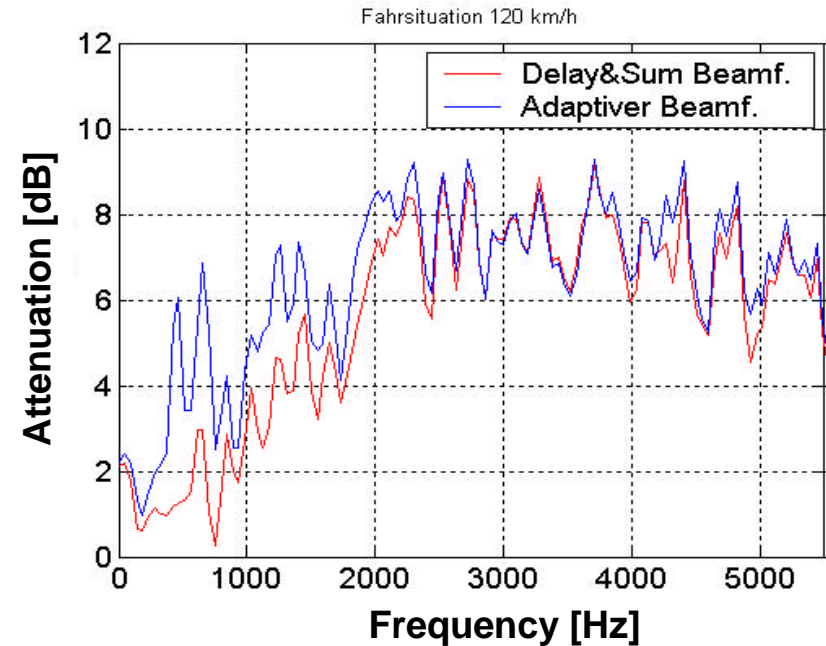

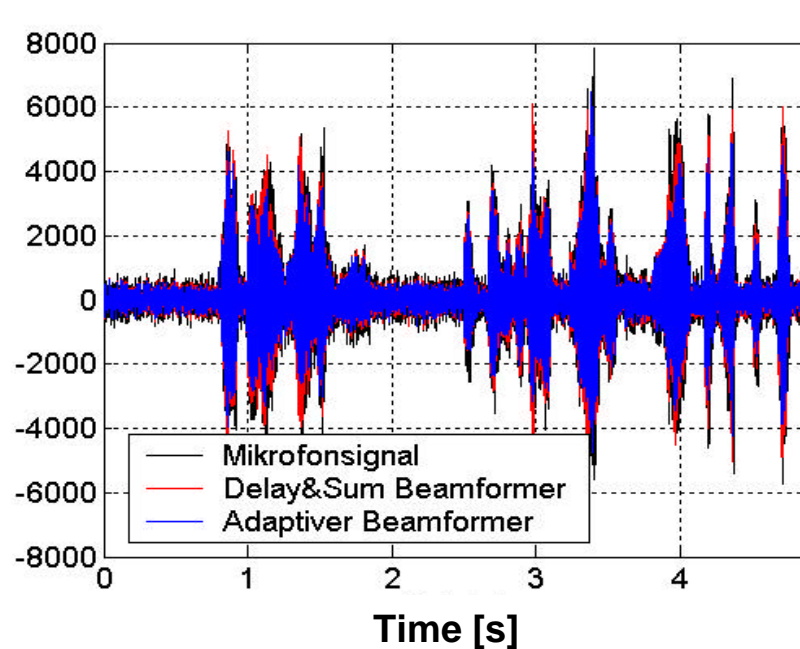

## 4 Microphone Array Integrated in Interior Mirror

- Cost-efficient integration due to integrated microphone module
- Fixed steered beamformer could be used as driver direction of arrival (DOA) varies only within a small range ( $62^{\circ}$ - $75^{\circ}$ )
- Microphone array could be used by driver and co-driver

# Beamforming Examples

Driving Situation 120 km/h

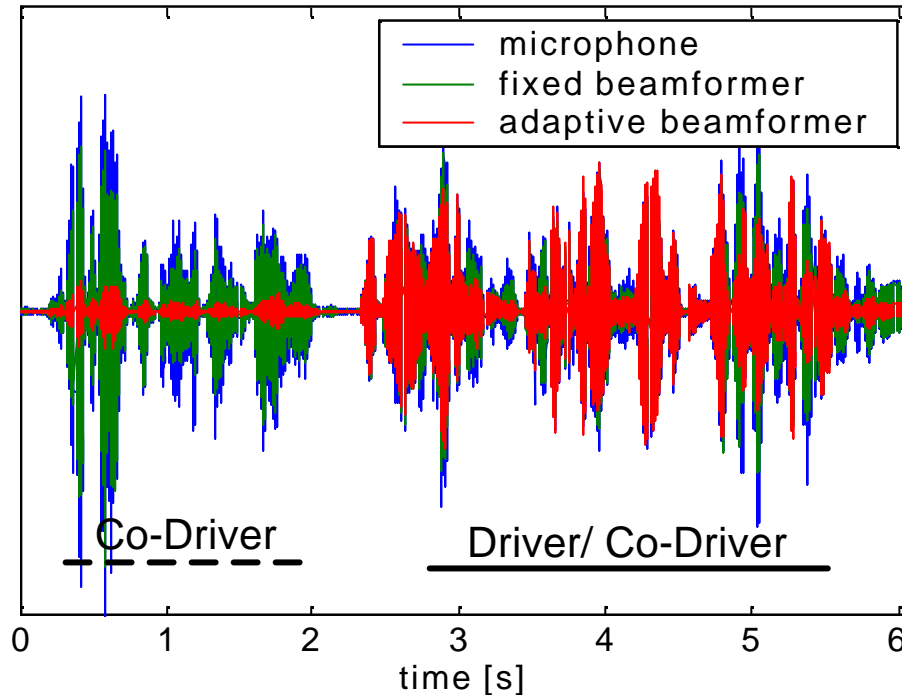

Significantly higher noise suppression in the low frequency range with the adaptive beamformer compared to the delay & sum beamformer

# Beamforming Examples

## Interfering Co-Driver

Single Microphone

Fixed Beamformer

Adaptive Beamformer

Suppression of interferer >15dB by adaptive beamformer

# Beamforming Examples

Speech recognition tests: 50 speakers, 1000 digits strings with in sum 9000 digits per situation

reduction of word error rate referring to a single beamformer microphone

Reduction of word error rate by adaptive beamformer is significantly higher than 50%!

# Beamforming

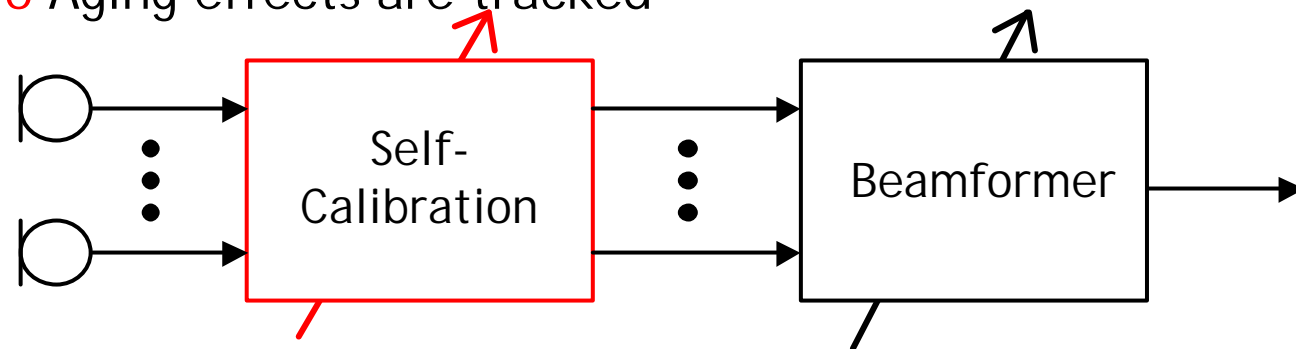

## Adaptive Self-Calibration

**Problem:** Beamformers are very sensitive to a mismatch of the microphones. Mutual deviations of the individual microphones may provoke a significant distortion of the beamformer output signal. Deviations inevitably occur due to fabrication tolerances and aging of the microphones.

**Solution:** The mutual deviations of the microphones are compensated in a preprocessing unit which adjusts itself adaptively without being noticed by the driver.

**Benefits:**

- A costly calibration of the beamformer can be saved
- Aging effects are tracked

ITU-T

# Beamforming Adaptive Self-Calibration

microphone  
signal

adaptive  
beamformer

adaptive beamformer  
with self-calibration

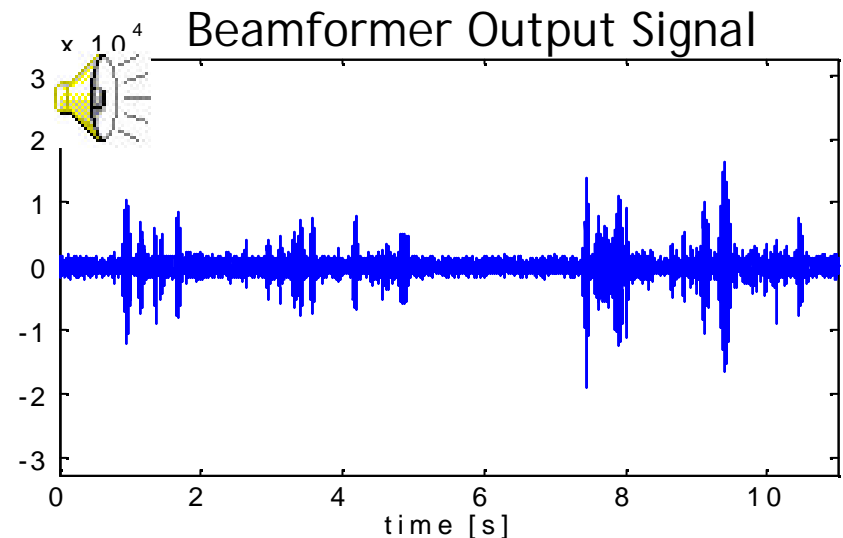

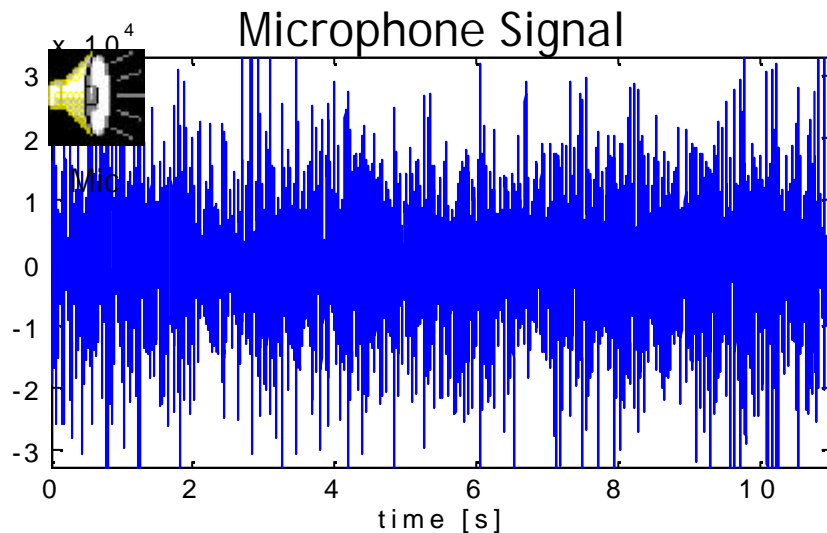

# Beamforming

## Wind Noise Suppression

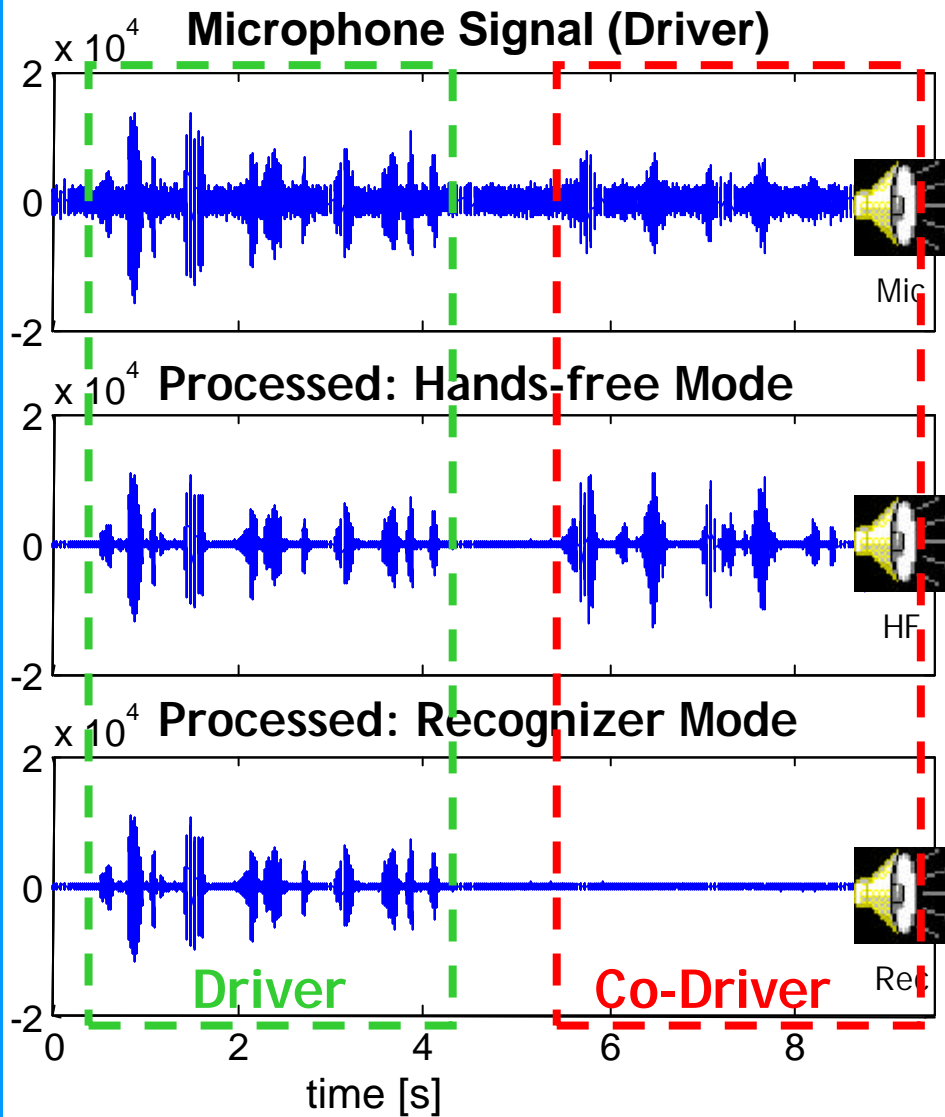

**Problem:** Wind noise can provoke strong pulse-like disturbances of the microphone signals. In cars, this problem is mainly caused by the fan or an open top of a convertible.

Due to design reasons or lack of space the standard wind shield of the microphones is often insufficient.

**Solution:** Suppression of wind buffets by a (multi-channel) wind-noise suppression algorithm

# Compact Dual-Microphone-Array

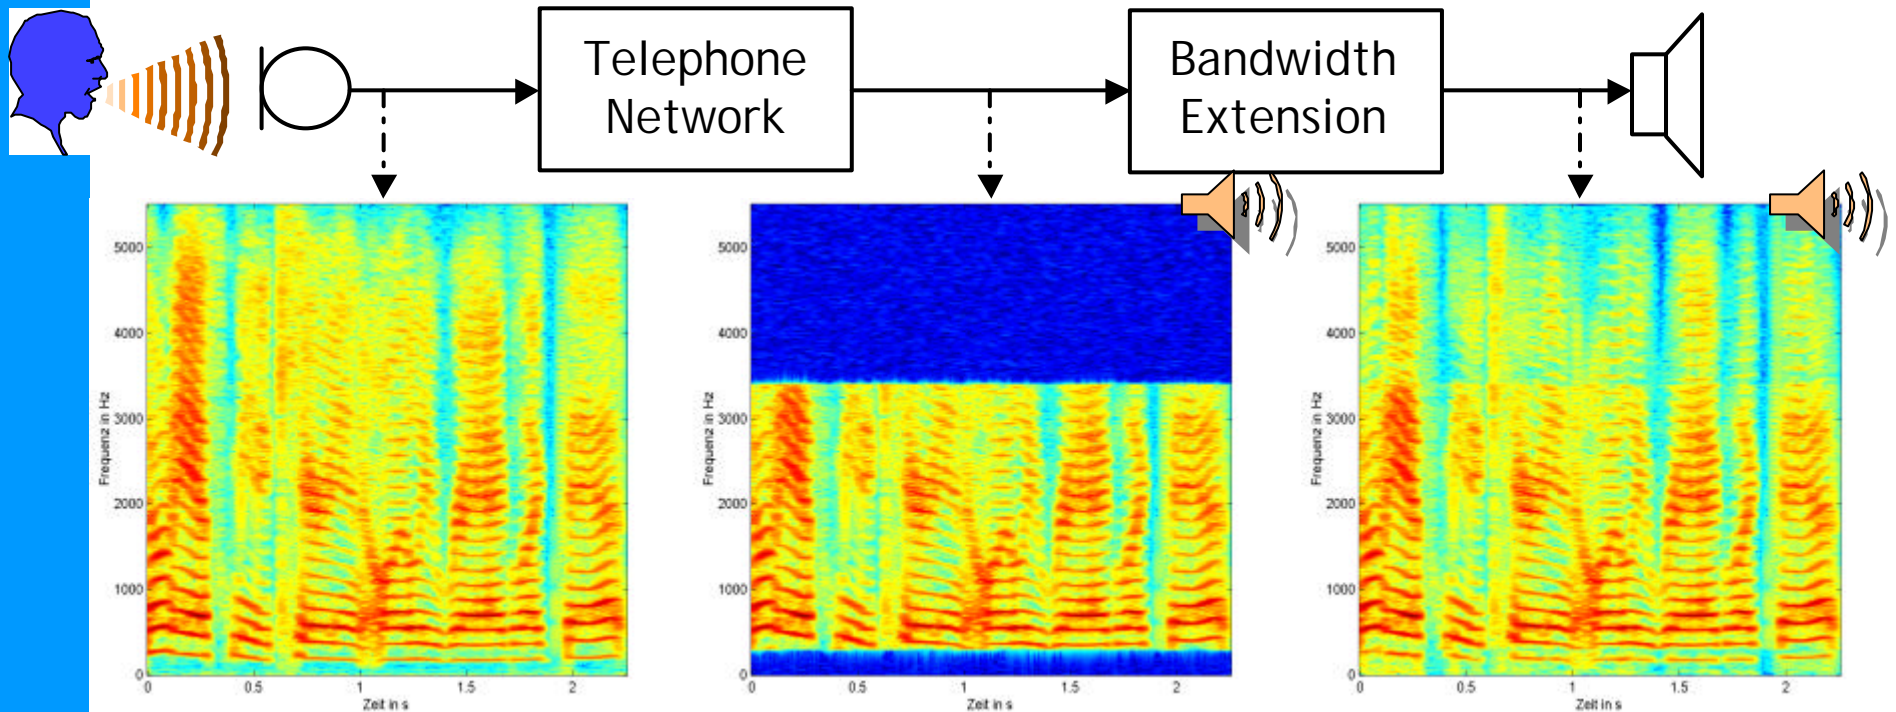

ITU-T

# Bandwidth Extension

**Problem:** Degradation of speech quality due to the bandwidth limitation of the telephone network

**Solution:** Extrapolation of missing frequency components from the received speech signal

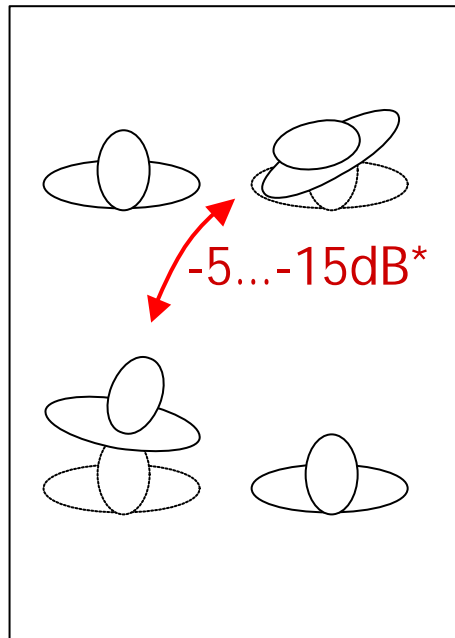

The Fully Networked Car, A Workshop on ICT in Vehicles  
ITU-T Geneva, 2-4 March 2005

# In-Car Communication

Passenger compartment

\*Acoustic loss  
(referred to the ear  
of the driver)

## Current Situation:

- Communication between passengers is difficult, because of the acoustic loss (especially front to back)
- Front passengers have to speak louder than normal - longer conversations will be tiring
- Driver turns around - road safety is reduced

## Solution:

- Improve the speech quality and intelligibility by means of an intercom system

## Application:

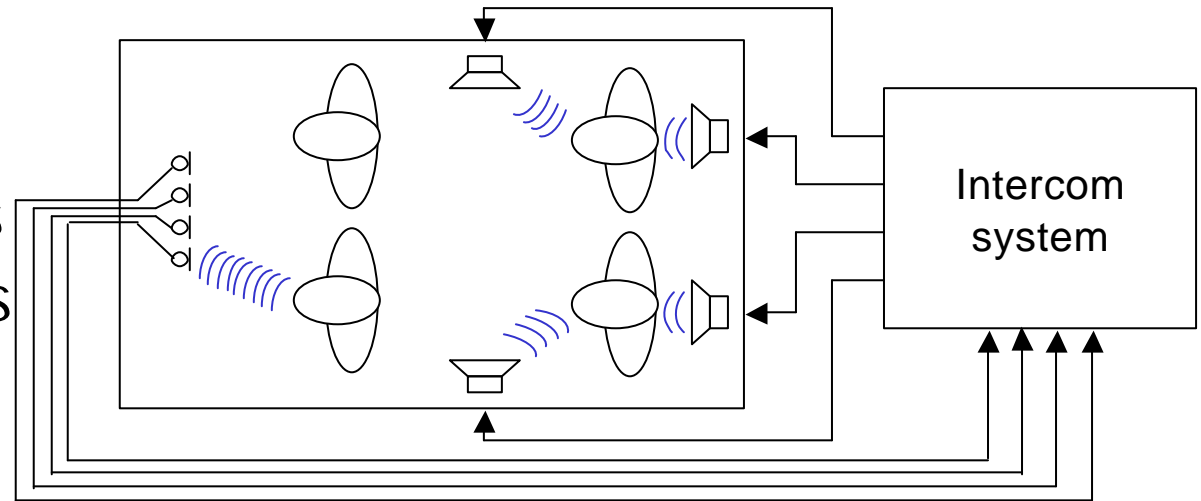

- Mid and high class automobiles, which are already equipped with the necessary audio and signal processing
- Vans, etc. → systems with reduced quality

# In-Car Communication Implementation

## One-Way System

- 2-4 microphones
- 2-4 loudspeakers

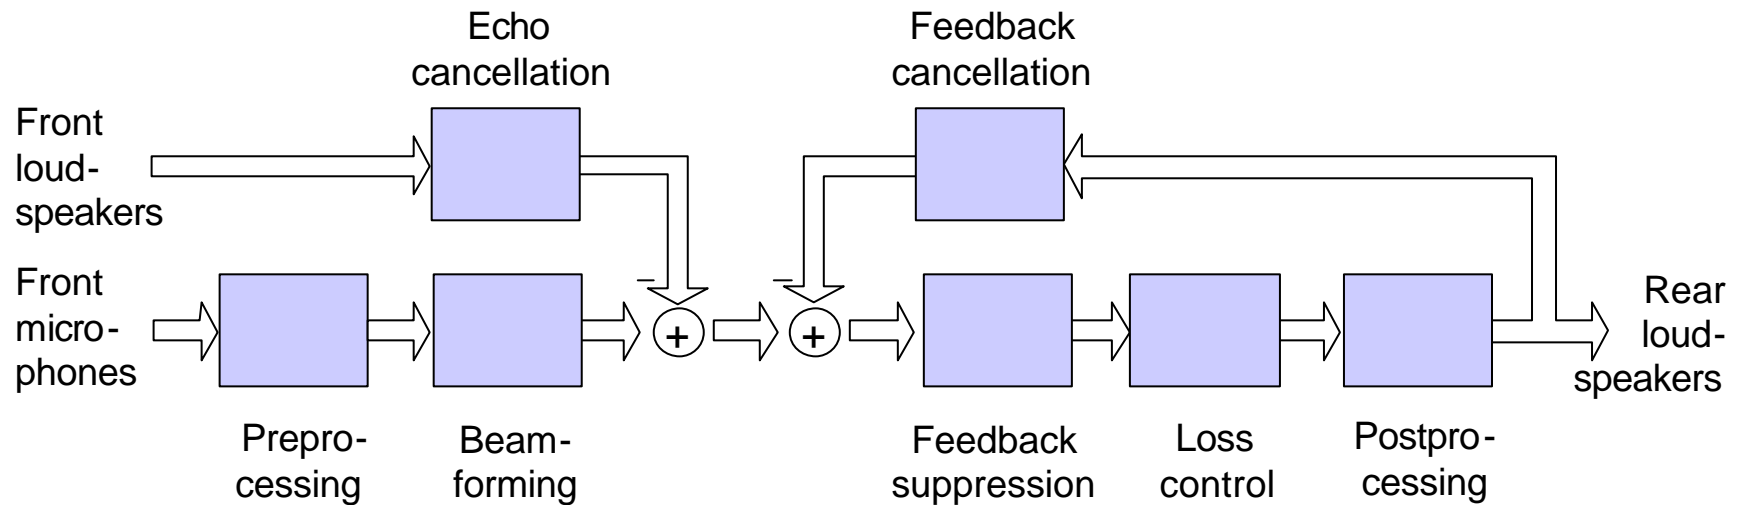

## Two-Way System

- 4-8 microphones
- 6-8 loudspeakers

# In-Car Communication Signal Processing Components

Algorithmic Structure for One Direction (Front → Rear):

## Problems and Challenges:

- Stability
- System delay
- Correlation of excitation and distortion

ITU-T

# In-Car Communication Demo System

4 microphones within  
the front top control unit

2x2 microphones (integrated  
within the rear grab handles)

ITU-T

# In-Car Communication Subjective Tests

- Prerecorded speech examples with different Lombard levels were played back via an artificial mouth
- Binaural recordings were made by means of a HEADacoustics NoiseBook on the seat behind the driver
- Driving-Situations
  - 0km/h beside motorway
  - 130km/h on motorway

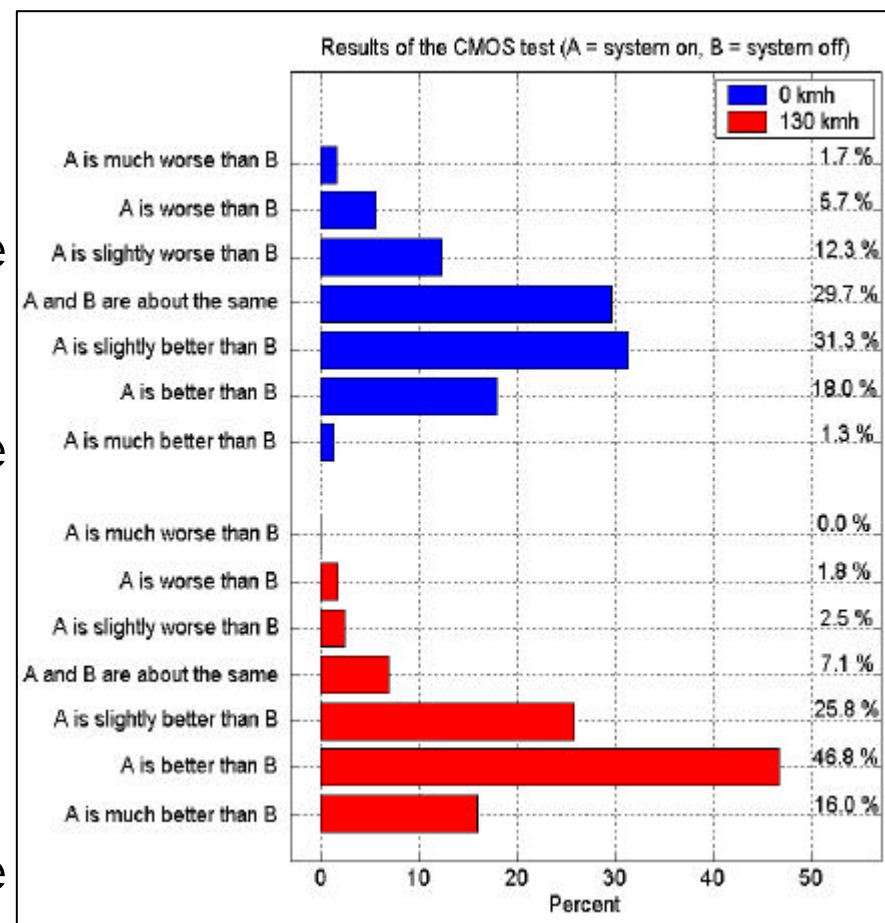

The Fully Networked Car, A Workshop on ICT in Vehicles  
ITU-T Geneva, 2-4 March 2005

# In-Car Communication

## Results of Speech Quality Test (CMOS-Test)

25 signal pairs per driving situation (intercom on/off) /  
15 listeners per scenario

- **0 km/h, vehicle parked close to a motorway**
  - 19,7% prefer the system to be switched off
  - 29,7% have no preference
  - 50,7% prefer the system to be switched on
  
- **130 km/h, motorway**
  - 4,3% prefer the system to be switched off
  - 7,1% have no preference
  - 88,6% prefer the system to be switched on

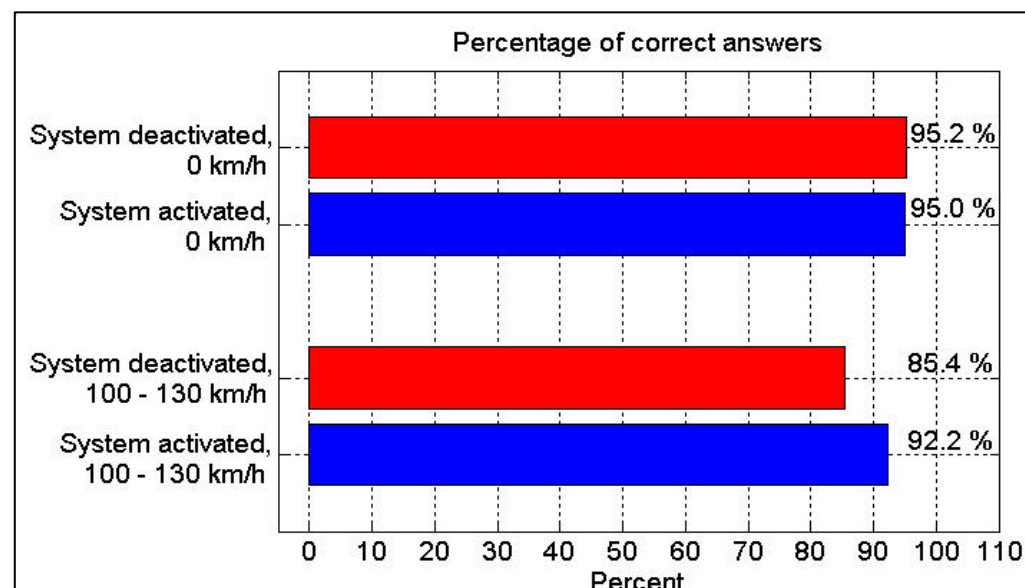

# In-Car Communication

## Results of Speech Intelligibility Test (MRT)

48 utterances were presented to each listener per driving situation

- 0 km/h, vehicle parked close to a motorway
  - No significant difference (95.2% correct answers for system on versus 95.0% for system off)
  - Due to the automatic gain adjustment the intercom system operates with only very small gain at these noise levels
  
- 130 km/h, motorway
  - Significant improvement of speech intelligibility by the intercom
  - Nearly 50% error reduction

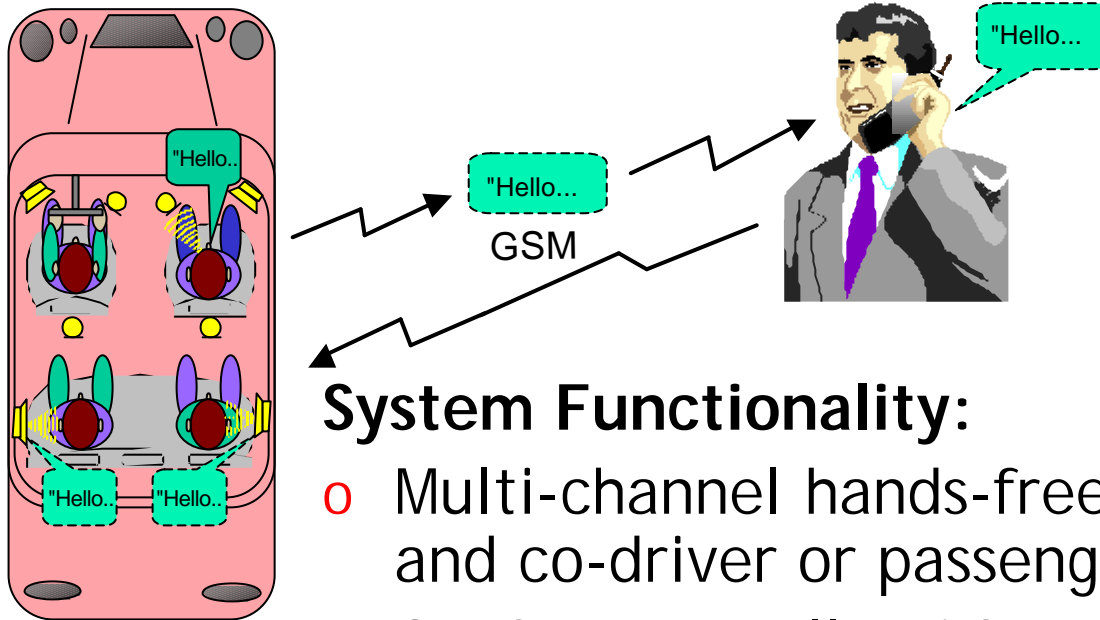

ITU-T

# Conference Calls/ In-Car Communication

## System Functionality:

- Multi-channel hands-free system for driver and co-driver or passengers on the back seats
- Conference calls with up to 4 partners with intercom functionality from the front to the back
- Intercom functionality between passengers in the front and in the back
- Speech recognition capabilities available for all seats

**Thank you for your  
attention!**
