United Nations – Economic and Social Council

Economic and Social Council

Commission on the Status of Women
Forty-seventh session
3-14 March 2003
Item 3 (c) (i) of the provisional agenda*
Follow-up to the Fourth World Conference on Women
and to the special session of the General Assembly entitled
"Women 2000: gender equality, development and peace
for the twenty-first century: implementation of strategic
objectives and action in the critical areas of concern and
further actions and initiatives"

Participation in and access of women to the media, and information and communication technologies and their impact on and use as an instrument for the advancement and empowerment of women

Report of the Secretary-General

Summary

The present report summarizes past efforts of the United Nations system in the area of women and the media and information and communication technologies (ICT). In reviewing the gender dimensions, the report focuses on opportunities, with particular emphasis on women's participation and access to media and ICT. The report then reviews the challenges to and impact on women's empowerment through ICT and new media. The report concludes with a series of recommendations for consideration by the Commission on the Status of Women.

* E/CN.6/2003/1.

Contents

I. Introduction

1.   In accordance with the multi-year programme of work for 2002-2006 adopted by the Economic and Social Council in its resolution 2001/4 of 24 July 2001, the Commission on the Status of Women will review two thematic issues at its forty-seventh session, in March 2003. The present analytical report covers the theme "participation in and access of women to the media, and information and communication technologies and their impact on and use as an instrument for the advancement and empowerment of women".

2.   In order to contribute to a further understanding of the issues and to assist the Commission in its deliberations, the Division for the Advancement of Women of the Department of Economic and Social Affairs convened two expert group meetings. One meeting, on information and communication technologies and their impact on and use as an instrument for the advancement and empowerment of women, took place in Seoul from 11 to 14 November 2002.[1] A second meeting, on participation in and access of women to the media, took place in Beirut from 12 to 15 November 2002.[2] In both meetings, the Division collaborated with relevant entities of the United Nations system (the International Telecommunication Union (ITU) and the United Nations Information and Communication Technologies Task Force secretariat in the Seoul meeting and the Department of Public Information, the Economic and Social Commission for Western Asia and the United Nations Educational, Scientific and Cultural Organization in the Beirut meeting).

3.   The present report is based on the analysis and conclusions of the above-mentioned expert group meetings, on the case studies and contributions provided by the experts from various regions and representatives of United Nations entities and civil society and on the literature on the subject. Its recommendations are directed towards Governments, the United Nations system, intergovernmental and non-governmental organizations (NGOs), the private sector and civil society. They aim to expand an agenda for actions to be taken at all levels to accelerate the implementation of the Beijing Platform for Action and the outcome documents of the twenty-third special session of the General Assembly in those areas (resolutions S-23/2, annex, and S-23/3, annex).

4.   At its forty-seventh session, the Commission on the Status of Women will consider the relationship between information and communication technologies (ICT) and gender equality for the first time, building upon, and in continuation of, its past work on women and the media. The outcome of the Commission's deliberations should set a global policy framework on this question, and also serve as a critical contribution to the World Summit on the Information Society, which will be held in two phases, in 2003 (Geneva) and 2005 (Tunis). The World Summit on the Information Society[3] aims to develop a common vision and understanding of the information society (see General Assembly resolution 56/183 of 21 December 2001). Among the themes the Summit is expected to cover are questions of access to ICT for all, ICT as a tool for economic and social development and for meeting the millennium development goals (see A/56/326) and confidence and security in the use of ICT.

II. Efforts of the United Nations system

5.   The issue of women and the media has been on the international agenda since the first World Conference on Women, held in 1975, with the serious underrepresentation of women as protagonists and participants in media structures around the world being addressed as a major challenge. Women and media is one of the 12 critical areas of concern covered in the Beijing Platform for Action,[4] which identified an increase in the participation in and access of women to expression and decision-making in and through the media and new technologies of communication as one of its strategic objectives. Actions to be taken aim at women's equal access to all areas and levels of the media (para. 239 (a)), their full and equal participation in the media, including in management, programming, education, training and research (para. 239 (c)), their participation in the development of guidelines, as well as in information production, (para. 241 (a) and (d)), and training of women to make greater use of information technology for communication and the media (para. 242 (b)). The Commission on the Status of Women considered the question of women and the media in 1996 (agreed conclusions 1996/2), also stressing the need to support women's equal participation in all areas and all levels of media work, as well as in media advisory, regulatory and monitoring bodies; to strengthen the role of women in global communication networks; and to reduce barriers to women's involvement in information technology development. The issue was also taken up by the General Assembly at its twenty-third special session, held in June 2000, to review progress made in implementation of the Platform for Action, which called upon media networks to promote equal access for women and men as producers and consumers.

6.   The Platform for Action drew attention to the emerging global communications network and its impact on public policies as well as private attitudes and behaviour. It called for the empowerment of women through enhancing their skills, knowledge, access to and use of information technologies. At its twenty-third special session, the General Assembly recognized the increased opportunities created by information and communication technologies for women to contribute to knowledge-sharing, networking and electronic commerce activities. It also noted that poverty, lack of access and opportunities, illiteracy, including computer illiteracy, and language barriers prevented some women from using such technologies, including the Internet. Steps were proposed to ensure that women benefited fully from ICT, including equal access to related education, training and entrepreneurship opportunities, and equal access as producers and consumers of technology through public and private partnerships.

7.   The role of information and communication technologies as a tool for development has recently attracted the sustained attention of the United Nations. In 2000, the Economic and Social Council adopted a ministerial declaration on the role of information technology in the context of a knowledge-based economy.[5] Later that year, the Millennium Declaration (see General Assembly resolution 55/2) underscored the urgency of ensuring that the benefits of new technologies, especially those in the areas of information and communication, be available to all, and also resolved to promote gender equality and the empowerment of women as effective ways to combat poverty, hunger and disease and to stimulate development that is truly sustainable. In 2001, the Council considered the role of ICT for development in the context of partnerships with relevant stakeholders, including the

private sector.[6] In 2002, the General Assembly held a two-day meeting devoted to information and communication technologies for development (17 and 18 June; see A/57/280).

8. Based on the recommendation of the Economic and Social Council in its decision 2001/210 of 13 March 2001, the Information and Communication Technologies Task Force[7] was launched in November 2001 to help harness the power of ICT to advance the goals contained in the Millennium Declaration, in particular the goal of halving the number of people living in extreme poverty by 2015. The Task Force's mission statement and action plan recognize the potential of ICT for promoting gender equality and for enhancing women's educational, health and economic opportunities and their participation in public life.

III. Gender dimensions in information and communication technologies and the media

The emergence of information and communication technologies as a tool for development and participation

9. Information and communication technologies comprise a complex and heterogeneous set of goods, applications and services used to produce, distribute, process and transform information. The ICT sector consists of segments as diverse as telecommunications, television and radio broadcasting, computer hardware and software, computer services and electronic media (see the report of the expert group meeting).[1] These technologies, their applications and their combination in new and constantly evolving ways are giving rise to contemporary knowledge-based economies and societies (see also E/2002/52-A/57/71).

10. The advent and growth of new information and communication technologies and the growing convergence of all media made possible by advances in those technologies and in telecommunications have had a major impact on the media. With the spread of satellite communication and the introduction of previously unimaginable numbers of channels in many countries, the enormous power of the media to influence ideas and behaviour at all levels of society has become fully apparent. Internet-enabled electronic networking, web databases and information centres, web radio, web television, fax broadcasting, videoconferencing, CD-ROMs, special technologies for people with disabilities and other technological innovations serve to broaden the accessibility and reach of the media.

11. Information and communication technologies provide unique opportunities for economic growth and human development. They can shape and enhance a wide range of development applications — from electronic commerce to access to financial markets, from generating employment to providing opportunities for investment and growth, including of small and medium-sized enterprises, from improved agricultural and manufacturing productivity to the empowerment and participation of all sectors of society, from long-distance education to telemedicine and from environmental management and monitoring to prevention and management of disasters. The potential to help foster sustainable development, empower people — women and men, the young and the old, build capacities and skills, assist small- and medium-sized enterprises, reduce poverty and enhance participation and informed decision-making at all levels is enormous.

12. The arrival of digital technologies in general, and digital media technologies in particular, also provide the means for individuals, small groups and previously marginalized communities to participate in public life and socio-economic development and to express their views. These new technologies offer potentially important new audiences access to a wider range of sources of material and rapid means of information exchange.

13. As the digital revolution and the rapid growth of ICT are opening vast new opportunities, at the same time they are further widening the disparities between and within countries. In considering the role of ICT in the creation of a global knowledge-based economy and society, it should be noted that the majority of the world's population still lives in poverty and remains untouched by the ICT revolution. The "digital divide" or "digital exclusion" is characterized by unequal access to ICT due to factors such as lack of infrastructure, resources and investment, high costs of connectivity and low levels of technological skills, education and literacy. The spread of new technologies and their impact on the mass media are also creating a new communication and cultural environment, with many new concerns in relation to issues such as media freedom, cybercrime and intellectual property rights, as well as the continuation of many previously identified challenges and barriers in areas such as participation and access.

14. Information and communication technologies are not gender-neutral. Like any other technology, they are socially constructed, and affect men and women differently.[8] Globally, there are substantial differences in women's and men's access to and use and production of these technologies and the media, and women make up a disproportionate number of those who are marginalized or excluded from new opportunities. Such differences in access and opportunities have important implications for policy development both nationally and internationally.

15. It should be noted, however, that an understanding of gender issues with respect to ICT is hampered by the lack of reliable statistics and data, particularly on women's use of ICT. The major collector and disseminator of such statistics is ITU. Few if any of its data or indicators on ICT are at present disaggregated by sex.[9] There are no data on tele-density or Internet access, labour market statistics or ICT training statistics that are measured globally and that are relevant to gender equality in ICT. The lack of indicators is detrimental to current ICT research. For example, it means that most assessments of e-readiness (i.e., the ability to take advantage of electronic resources) cannot give much evidence as to the various states of readiness within a population. Given that e-readiness assessments are generally influential in and seen as forces driving ICT policy, this lack of data likely contributes to greater gender inequality in the ICT area.[10] Research continues to document women's absence from senior decision-making positions in the media worldwide. Likewise, no apparent progress is being made in transforming media content, where one study showed that in 1995, 17 per cent of news sources were women, with the number rising to 18 per cent in 2000 (see the report of the expert group meeting).[2]

Women's participation in and access to the media, and information and communication technologies as a tool for the empowerment of women

16. For those women who can access and use them, information and communication technologies and new media offer many benefits, especially in terms of reducing poverty, improving governance, overcoming isolation, providing a voice

and advancing gender equality. There is a growing body of evidence of how women are using these technologies for their empowerment and advancement.

17. Information and communication technologies are improving women's economic livelihoods by expanding access to local and international markets for women producers and traders and by increasing access to jobs, education and training and entrepreneurial opportunities. Women are taking advantage of the increased flexibility in employment conditions to combine roles in the care economy with professional roles. In some countries and regions, women are benefiting in large numbers from new jobs created through ICT, such as in the software industry and the data-processing sector.[11] The necessary adaptation of ICT to women's needs is also reshaping the content of those technologies and is creating new lines of research that are developing new kinds of specialists and new employment opportunities.[12]

18. Women are increasing their access to health, nutrition, education and other human development opportunities, such as political participation, through ICT-mediated delivery channels. Women are also making extensive use of technology services to mobilize for women's empowerment and societal well-being.[13] Solutions such as telecentres have proved useful in providing women with access to the Internet by sharing connection costs, creating learning experience and knowledge and supporting the creation of networks.

19. By using one of the most important democratizing aspects of the Internet — the creation of secure online spaces, protected from harassment — women are enjoying freedom of expression and privacy of communication to oppose gender discrimination and promote women's human rights. New technologies, as well as the combination of well-established technologies (i.e., radio, television, landline telephones) with such innovations as computers, the Internet and satellite telephones, are narrowing the distance between citizens, and between them and decision-making processes, and increasing opportunities for women's participation in public life.

20. The advent of new technologies and the growing convergence of all media are having a major impact on the information and communication work done by the women's movement. There are increased opportunities for national, regional and global distribution of women-generated news, much of which, in the past, was limited in outreach. The Internet has brought women's news and views into the public domain, with countless web sites targeted specifically, if not exclusively, to women. The Web has also supported the creation of strong online women's communities, and many "connected" women act as bridges to unconnected groups in their communities by repackaging information they find online and sharing it through other communication channels and in different languages.

The impact of information and communication technologies and new media on women's empowerment

21. Women are increasingly taking advantage of the opportunities created through ICT. At the same time, many factors determine the extent of women's access to and control of such technologies and the media as users, producers and consumers. If those technologies are a tool for development, it is imperative to ensure that women not only understand their significance, but also that an environment is created that will allow them to access and use them for their empowerment and the promotion of

gender equality. Experience from many other development sectors shows that explicit attention is required in order to ensure that gender perspectives are addressed in the various stages of policy design, implementation and follow-up. While information and communication technologies for development have only recently captured international attention, shortcomings and gaps in terms of attention to gender aspects have already become apparent, and insights gained and lessons learned in other socio-economic sectors are insufficiently applied.[14]

22. Women encounter socio-economic, cultural and political barriers and challenges that differ in important ways from those of men and that can prevent women from reaping the full benefits of the information age, as well as from being active participants in the shaping of the information society. Income, time constraints, degree of literacy, level of education and cultural contexts affect access to new media and ICT-related facilities, training and employment. While information and communication technologies in and of themselves cannot create gender equality or end poverty, they can be tools for social action and positive social change towards gender equality. In order to ensure that those technologies indeed become a tool for the empowerment of women and to prevent their disadvantageous or discriminatory impact on women, there is a need to address specifically and explicitly in ICT-related policies and activities unequal power relations between women and men, the persistence of gender-specific structural inequalities between women and men and gender-based discrimination and inequalities in many areas.

23. Most national ICT policies are silent on gender issues and do not address gender equality goals. (See appendix II to the report of the expert group meeting,[1] which identified the Republic of Korea as one of the few countries in which gender equality is addressed in regard to ICT policies.) However, all areas commonly covered by national ICT policy — many of which are specifically relevant to media operations — have gender aspects (see appendix I to the report), and the integration of such aspects into the policy process is critical for ensuring that gender dimensions are addressed to prevent or remedy continuing differential and disadvantageous effects on women. Women's poverty levels, as well as their geographical location, are important aspects to be considered before decisions are made on issues such as infrastructure development, network deployment or technology choice, broadcast licensing and frequency distribution, as well as in planning universal access. Choices that have an urban bias and high cost will in general reduce access for women. As more women, particularly in developing countries, tend to live where infrastructure is poorly distributed or not available at all, such infrastructural imbalances may adversely affect many women, particularly those in poor urban and rural areas,[15] and the cost of technology and access also present barriers for many women in developing countries in using new technologies for economic advancement.

24. Discussions and policy development on gender equality on the one hand and on ICT and the media and communication systems on the other tend to be carried out in parallel, and are almost never interconnected at the international, or even the national, level. Women's concerns about access, use, content, communication rights and freedom of expression are rarely taken into account in wider debates about ICT as a tool for development, free speech, media control or communication structures. An essential and urgent step in the pursuit of women's advancement and empowerment in and through ICT and the media must be an insistence on the centrality of the gender equality goal as an integral part of the efforts to secure the

benefits of ICT as a tool for development for all and to establish free and democratic media structures in society today. Narrowing the gap between ICT policy makers and gender equality advocates remains a major challenge.

25. With access and cost being two of the most serious challenges to women's access to and use of ICT and new media, there is a need to consider the way in which ICT-related resources are allocated through policies and projects. Universal access policies, resources for training and capacity-building for women in the use of ICT and the use of funds for projects targeted to women deserve particular attention. Even where there are policies and programmes in place to improve access, for example, through public service and community media or telecommunication development funds that can be used to establish ICT access points so as to contribute to women's empowerment, few women's organizations or organizations working towards gender equality benefit from those programmes.[16]

26. Women's use and, especially, control of information and communication technologies, resources and media and broadcasting systems is also affected by the low level of women's political participation and their representation in decision-making structures in the ICT and media sectors (see the report of the expert group meeting,[1] particularly the box on women in telecommunication decision-making structures). Representation contributes to the creation of a framework that will enable women to maximize their possibilities to benefit from ICT and the media. It also enhances accountability to women of the institutions that develop ICT and media policies and in the development of policies in those areas that result in changes towards equal gender relations.

27. ICT decision-making, including that of policy and regulatory institutions, is more commonly considered as a technical rather than a political or social issue. Relevant bodies and institutions generally include only government and corporate interests, with few opportunities for civil society to presents its views. As awareness and knowledge about the significance of ICT for development as well as the gender dimensions of ICT are generally low, there is a need to build constituencies for gender equality in ICT development within civil society and government, especially within national machineries for the advancement of women and government bodies involved in all aspects of ICT. Gender equality advocates need to undertake self-education in gender analysis of ICT and become actively involved in national policy-making, including with regard to the impact of ICT on media and communications.

28. Women are also often additionally disadvantaged in their access to and use of existing ICT and media facilities, especially in developing countries, because of their lower level of education and skills. Women's higher rate of illiteracy compared with men and their lack of ICT training hinder their entrance into the information economy. The dominance of the English language in software and content affects women more, as women globally are less likely than men to know English. Persistent cultural constraints, such as stereotypical views of the roles of men and women, also affect the ICT sector. Gender bias is reflected in attitudes towards girls and women studying or using ICT,[17] and the significantly lower number of female science and technology students in most countries is a further barrier to women's full participation in the information age.

29. There is a dearth of information, research and codified knowledge on women and the educational use of ICT worldwide. Furthermore, continuing restricted access

to education, particularly for girls, high teacher-pupil ratios in classrooms, a shortage of qualified educators, budgetary cuts in education and limited infrastructure contribute towards a proliferating social crisis in education, especially in the developing world. For example, in Africa, an estimated 45 million youth do not have access to education. There girls make up the larger proportion of youth out of school. A recent study revealed that the percentage of female enrolment in primary school in Africa has remained the same, at 45 per cent, and has shown only a 1 per cent increase at the secondary level.[18] The introduction of ICT in this context will increase the gender gap with respect to ICT skills and knowledge.

30. Applications that accommodate the needs of illiterate women and local language adaptations remain limited but are necessary to increase women's access to and use of ICT.[19] Likewise, the content that predominates on the Internet and in new media, and especially the lack of adequate reflection of women's viewpoints, knowledge, needs and interests, as well as the portrayal of women, may prevent women from using those technologies. Journalistic content on the Internet currently reflects existing patterns in terms of the sources and priorities of the news, as well as traditional gender patterns in the selection of stories. On the other hand, when content relevant to women is available and women can consult such information, in private when necessary, the relevance of the technology for women increases and their marginalization in media and communication processes is reduced. The absence of information on women's rights and on remedies for violations reduces the usefulness of the technology for women. Use will increase where information on concerns such as HIV/AIDS prevention and related support systems is provided through new technologies in ways that overcome cultural and social biases that restrict women's access to traditional sources of information.

31. The opportunities at present provided by Internet-based e-learning, mainly in the developed world, could undercut women's achievements in their participation in higher education in particular. As women are disadvantaged in ICT access and skills, their participation in e-learning is also limited.

32. A lack of gender awareness also affects perceptions regarding users' needs and preferences. Women's mobility, in terms of both their access to transport and their ability to leave the home, is frequently more limited than that of men. Given women's multiple roles and family responsibilities, decisions on the location of telecentres and other community access points, opening hours and staffing can disadvantage and exclude women from using ICT-related opportunities. For example, women may encounter greater social and cultural constraints to using a telecentre that is located near a place where men commonly gather than one that is located near a school and managed by women.

33. Labour is highly segregated in the ICT industry.[20] Women are concentrated in end-user, lower skilled and lowest paid jobs related to information processing, banking, insurance, printing and publishing, and outsourced jobs for women are in call centres, information services, data entry, geographical information systems and software programming. However, women make up a small percentage of managerial, maintenance and design personnel in networks, operating systems and software. More women are becoming software programmers but very few are in hardware design. Women comprise the majority of those employed in computer and electronic assembly manufacturing jobs, but the first generation of women workers in ICT industries, first in developed and now in developing countries, are not being

trained for new, more advanced jobs. Women have rarely reached high-level positions in information technology at the technical, managerial or decision-making levels. The concentration of economic power in global multinational firms has not increased leadership opportunities for women. ICT can also threaten the livelihoods of women when they lead to the elimination of jobs women have been performing.[21]

34. Although more women are entering and using the media, concerns about women's access, employment and decision-making remain. There are particular barriers to women in certain sectors of the media, for example political, business and sports journalism; the persistence of a glass ceiling prevents many women from rising above the middle echelons within media organizations; and research also points to a high attrition rate of women in the media industry.

35. In many countries women are moving increasingly into web development and design. However, few women are ICT entrepreneurs. In order to bring the benefits of an ICT-based economy to a large number of women, certain areas require improvement, such as access, including infrastructure, cost and connectivity, and focus on content and language. This is particularly important for women in the informal sector and women living in rural areas. E-commerce policies rarely accommodate the activities of women traders, and there is a lack of intermediaries or brokers to facilitate the process.

36. Boundaries of work time in the technological society do not recognize men's and women's multiple roles, and labour laws may prevent women's full participation in the information economy. Inequitable global terms of trade have resulted in low wages and poor working conditions for many women working in offshore ICT manufacturing. The high risk of unemployment in the ICT sector, frequently combined with unfavourable labour contracts, produces hardship for women working as ICT professionals. Some highly profitable aspects of the ICT economy, such as pornography, sexually exploit women.

37. E-governance focuses on how new technologies can be used to strengthen the public's voice as a force for reshaping democratic processes and to refocus the management, structure and oversight of government to better serve the public interest.[22] At present, e-governance policies, where they exist, are essentially gender-blind and do not recognize the existence of gender gaps in access to government services and political processes, especially of women living in rural or remote areas or who are otherwise marginalized.

38. Attendees at the World Summit on the Information Society are expected to agree on policy goals in the information society. An important opportunity exists to identify and address the gender perspectives in regard to all aspects that will be covered by the Summit, including a recognition that ICT policy does not equally affect women and men. This is especially critical, as the Summit's outcome will provide guidance for national ICT policy development. To the extent that the Summit is able to set a standard for mainstreaming gender concerns, the gender equality goal will be more effectively pursued at the national level.

IV. Recommendations for action

39. **A focus on the gender dimensions of information and communication technologies is essential not only for preventing an adverse impact of the digital**

revolution on gender equality or the perpetuation of existing inequalities and discrimination, but also for enhancing women's equitable access to the benefits of information and communication technologies and to ensure that they can become a central tool for the empowerment of women and the promotion of gender equality. Policies, programmes and projects need to ensure that gender differences and inequalities in the access to and use of ICT are identified and fully addressed so that such technologies actively promote gender equality and ensure that gender-based disadvantages are not created or perpetuated. Such a perspective should make it possible to reduce, if not eliminate, the gender gap in the digital divide. Efforts are also necessary to increase women's participation in and access to new media opportunities created through ICT.

40. The Commission may wish to consider the following actions towards securing the benefits of the information age for girls and women.

A. Creation of a gender-sensitive enabling environment and integration of gender perspectives in the development and implementation of national policies and strategies in the area of information and communication technologies and media and communication policies

41. Governments at all levels, governmental bodies and regulatory agencies responsible for ICT, communication and media policies, national machineries for the advancement of women, international organizations, including the United Nations system, research and academic institutions and civil society should:

(a) Adopt and implement legislative, regulatory and administrative measures to promote gender equality in all sectoral areas specific to information and communication technologies;

(b) Ensure that gender perspectives are taken into account when developing technical and regulatory instruments for such policy issues as universal access, including cost and connectivity, licensing, tariffs, spectrum allocation, infrastructure, ICT industry development and labour policies;

(c) Create monitoring frameworks, including reporting mechanisms, and capacity to ensure the implementation of gender-sensitive ICT policies and regulations;

(d) Ensure that, when adopting measures concerning privacy and security in ICT, the particular interests and concerns of women, such as issues relating to violence against women and trafficking in women, are fully addressed;

(e) Strengthen the capacity of national machineries for the advancement of women, including through the provision of financial resources and technical expertise, to take a lead advocacy role with respect to ICT and gender equality, to encourage and facilitate collaborative action among government bodies with responsibilities for ICT and for gender equality and to participate actively in national preparatory activities for the World Summit on the Information Society;

(f)   Put in place measures that ensure the increased representation and participation of women in technical and regulatory bodies at all levels of the policy formulation and implementation process and in international coordination efforts with respect to media, ICT and telecommunications;

(g)   Support and provide training for gender and ICT specialists, as well as for gender and communication specialists, and integrate gender analysis into ICT-related training efforts for policy makers;

(h)   Include content about gender perspectives in all official government web sites, in addition to those that specifically cover gender equality issues;

(i)   Develop, promote and implement research programmes on the impact of ICT on gender equality;

(j)   Support and encourage research programmes to adapt ICT to the needs of poor and, especially, illiterate women;

(k)   Take concrete steps to increase the number of female students in the fields of science and technology and ICT, as well as the number of women researchers, scientists, educators and administrators at all levels, especially at the tertiary level, in technical fields related to ICT so as to increase the number of women in ICT-related careers at all levels, and especially in the development of technologies, hardware design and production and software engineering;

(l)   Support, for example through training and mentoring systems, the capacity of women, women's organizations and journalists to create, access and share, through ICT and traditional media channels, information that serves the needs of different groups of women and girls, including illiterate women and women with disabilities who have specific technological needs, and to use ICT and other media for economic, social and political participation;

(m)   Encourage gender-equality advocates to educate themselves about the potential of ICT to promote gender equality, and to involve themselves in ICT policy-making processes;

(n)   Increase the use of local languages and support the development of a wide range of ICT-based programmes in local languages with content relevant to different groups of women, such as rural women;

(o)   Develop e-governance mechanisms and participatory approaches in support of women's voices and strengthen their capacity to monitor government action in ICT-related areas;

(p)   Ensure that all projects on ICT for development include gender dimensions, as well as specific activities for women, in order to increase women's access to ICT facilities and applications and participation in the ICT area;

(q)   Increase efforts to compile statistics on ICT use disaggregated by sex and develop gender-specific indicators on ICT use and needs;

(r)   Identify measurable performance indicators to assess the impact of funded ICT projects on the lives of girls and women.

B. Promotion of women's participation and employment in the information society

42. Governments and regulatory bodies, international organizations including the United Nations system, and other actors, such as trade unions, business, professional and media organizations and the private sector should:

(a) Promote and strengthen women's entrepreneurship in the ICT sector, including by supporting role models and mentoring programmes and by encouraging the creation of networks and of business support programmes and linkages nationally, regionally and internationally;

(b) Develop programmes to enable women entrepreneurs to keep up with rapid changes in technology and increase their economic opportunities in ICT;

(c) Develop ICT-based information systems with relevant content, including information about national economic and trade policies and programmes, to enable women to increase their economic opportunities and entrepreneurship skills;

(d) Ensure that women gain access to promising new employment opportunities in the ICT area, including by increasing women's access to ICT literacy and skills at all levels, and also ensure that women are not disproportionately disadvantaged by the working conditions and organizational climate common within the global ICT industry, such as flexible employment practices;

(e) Develop ICT-based economic opportunities for women, especially rural women, such as telecentres, community access points and business incubators;

(f) Take steps, in particular by providing ICT education, training and access to credit and by promoting and recruiting more women at decision-making levels of the ICT sector, to ensure that women entrepreneurs, including small and micro-entrepreneurs, can take advantage of e-commerce opportunities;

(g) Enhance the use of ICT to increase women's economic literacy and economic empowerment by, among other things, promoting ICT education and training at all levels, encouraging educated women to acquire ICT skills, expanding women's participation in ICT-enhanced enterprises, including by scaling up and sustaining successful pilot projects, setting up economic-enterprise incubators and establishing mentoring programmes;

(h) Set targets for and monitor the achievement of gender balance among media personnel in different categories and levels of media employment, including technical areas of operation;

(i) Establish policies and procedures for recruitment, remuneration, promotion, work assignment and other aspects that affect professional access, employment and advancement that are guided by a commitment to gender equality;

(j)   Provide management, negotiation and leadership training for women to help them succeed in media companies;

(k)   Conduct and support research into patterns of employment of women and men in the media and barriers to women's advancement, publicize the findings and implement measures to ensure that women are enabled and encouraged to stay in the media;

(l)   Support community media as a form of media that is accessible to women;

(m)   Encourage gender balance in private and community-based media in the process of granting licenses to broadcasters;

(n)   Ensure that gender considerations are integrated into audience and readership surveys and that such surveys provide data disaggregated by sex and gender-specific information.

C.   Mobilization of resources to promote gender equality in the media and in information and communication technologies

43.   All stakeholders, including Governments, international organizations, including the United Nations system, bilateral and multilateral donors, foundations and the private sector should:

(a)   Provide resources to support innovative projects in support of gender equality in ICT;

(b)   Support the production of content that is particularly relevant to women's interests and concerns, including in areas of education and health;

(c)   Increase, in existing funding mechanisms, the share of funds dedicated to ICT and gender equality components, identify new funding sources for such activities and ensure that gender perspectives are taken into account in all ICT funding mechanisms;

(d)   Increase funding for ICT and gender-equality activities and provide funding for NGOs to strengthen opportunities for women's empowerment and participation through ICT;

(e)   Allocate, in national budgets, resources to support strategies to increase women's participation in the information society;

(f)   Encourage Governments to work with the ICT-related private sector to mobilize resources for gender-responsive ICT-based projects and programmes;

(g)   Address infrastructure concerns that have a disproportionate impact on poor women and women living in remote or rural areas, such as poor connections to the telecommunication system and poor distribution of services, as well as the cost of both hardware and software;

(h)   Provide resources for civil society organizations, especially women's organizations, to enhance grass-roots participation in ICT as well as in communication and media policy processes;

(i) Use legal and regulatory means that enable public and community media to work in support of gender equality, for example, scaled licensing fees, the reservation of a portion of the broadcast and telecommunication spectrum for rural access and cross-subsidization from the private sector;

(j) Support the development of practical tools for gender and media policy development, training, monitoring and consumer awareness.

D. Inclusiveness and participation in the promotion of gender equality in the information society

44. Civil society, media organizations and others should:

(a) Participate in national and international ICT policy-making processes and raise gender-equality issues as they pertain to ICT;

(b) Raise awareness and build constituencies among a wide cross-section of women on the role of ICT in the promotion of gender equality and the empowerment of women;

(c) Adopt gender-sensitive professional codes and guidelines for coverage and representation, and encourage all media professionals to work in a manner that is supportive of gender equality;

(d) Avoid overreliance on information available via the Internet, and also seek out traditional information sources, bearing in mind that women — particularly women from developing countries — have few opportunities to make their information available on the Internet;

(e) Make a dedicated effort to seek out information generated by women, especially women from developing countries, that is available via the Internet;

(f) Provide gender-sensitive training for media professionals on the use and impact of ICT, particularly the Internet;

(g) Provide mentoring systems and other support strategies to enhance women's capabilities and potential for advancement in the media.

E. World Summit on the Information Society

45. All participants, and in particular the decision makers involved in planning the Summit, should:

(a) Include gender perspectives in every facet of the Summit — from policy and planning to action, monitoring and evaluation — and also include targets for the participation of women;

(b) Ensure active participation of gender-equality advocates in the preparatory process and the Summit itself to ensure that global ICT policy integrates gender-equality goals;

(c) Include women as leaders and decision makers in all Summit planning processes;

(d) **Facilitate and encourage the participation of women as members of national delegations and representatives of civil society and business by setting targets for delegations to include at least 30 per cent women, including gender and ICT experts;**

(e) **Implement an information dissemination campaign that includes a wide range of media, such as radio, drama and print media, in a variety of languages on ICT as a tool for the empowerment of women.**

Commission on the Status of Women
Forty-seventh session
3-14 March 2003
Agenda item 3 (c) (i)
**Follow-up to the Fourth World Conference on Women
and to the special session of the General Assembly entitled
"Women 2000: gender equality, development and peace
for the twenty-first century": implementation of strategic
objectives and action in the critical areas of concern and
further actions and initiatives**

Panel discussion on participation in and access of women to the media, and information and communication technologies and their impact on and use as an instrument for the advancement and empowerment of women

Summary submitted by the moderator

1.   At its second meeting, on 3 March 2003, the Commission on the Status of Women held a panel discussion followed by a dialogue on participation in and access of women to the media, and information and communication technologies and their impact on and use as an instrument for the advancement and empowerment of women, one of the thematic issues of the Commission's forty-seventh session. The panellists were Carolina Aguilar Ayerra (Cuba), Editorial Director of "Women of Cuba"; Ammu Joseph (India), freelance journalist and media analyst; Rosalind Gill (United Kingdom of Great Britain and Northern Ireland), lecturer at the London School of Economics; Concepción García Ramilo (Philippines), project manager for the Association for Progressive Communications Women's Networking Support Programme; and Sarbuland Khan, Director, Division for Economic and Social Council Support and Coordination, United Nations Department of Economic and Social Affairs. The panel was moderated by Birgit Stevens (Belgium).

2.   Participants noted that the emergence of new information and communication technologies (ICT) and the profound changes in global media and communication systems posed opportunities and challenges for the promotion of gender equality. They emphasized the role of ICT and the media as tools for development and as central to the empowerment of women. These new media and ICT were increasingly used to share knowledge, enhance participation of all members of society, increase

networking, give voice to marginalized groups, organize political action, empower people, fight poverty and enhance economic development. It was therefore particularly important to address gender-based discrimination and inequalities that undermined women's access to opportunities in the emerging knowledge and information society and also diminished the potential of ICT and the media to be an effective tool for the promotion of gender equality.

3.   A human rights approach framed the debate as participants placed emphasis on women's rights in the information society, with enhanced opportunities for democratic governance, the exercise of citizenship and full participation in development for all, based on rights to information and communication. Participants also made reference to the call in the United Nations Millennium Declaration (see General Assembly resolution 55/2) that ICT become available to all. As these technologies were seen as tools for the achievement of all the millennium development goals, their gender perspectives had to be addressed in their use.

4.   Participants underlined that consideration of the role of media and ICT in the empowerment of women presented the Commission on the Status of Women with a crucial opportunity for enhancing attention to gender perspectives in the ongoing preparations for the World Summit on the Information Society and for ensuring that gender equality was at the centre of global discussions on the future of the information society. While the draft declaration that had emanated from the second session of the preparatory committee of the Summit (17 and 18 February 2003) paid some attention to gender perspectives and the priorities and needs of women, participants were very concerned about the absence of relevant actions from the draft plan of action. It would therefore be especially important for participants in the Commission, particularly for representatives from national machineries for the advancement of women, to work with their national delegations to the Summit to strengthen attention to gender perspectives in the process and in the outcome documents. The Commission's agreed conclusions, as well as relevant reports before the Commission, would be important instruments in ensuring the success of those efforts. Steps were also needed to increase the number of women, as well as of gender experts, in governmental, business and civil society delegations in all activities related to the Summit and its preparations.

5.   Women's portrayal in the media remained an urgent challenge that had to be addressed across all regions and all types of media. It was noted that an increase in the number of women in media professions had not necessarily led to a less sexist or stereotyped portrayal of women in the media. New strategies were needed to increase awareness among all media professionals to change the images of women conveyed by the media, as well as to improve media content. This was especially necessary as sexist images and rhetoric had resurfaced in new media and in ICT. An increasing sexualization and normalization of pornography was now pervasive in all media, and the Internet was increasingly used to spread pornography and for trafficking of women and girls. Participants called for policies and adequate regulatory frameworks to address gender-based discrimination and, in particular, sexism in all media, as had already been proposed in the Beijing Platform for Action. At the same time, it was recognized that in any legislative and regulatory approach, a balance had to be found between women's rights and freedom of expression of the media and in ICT. Approaches used in other areas, such as the regulation of hate speech and licensing procedures, were mentioned as examples

that could give guidance in this regard. The lack of or insufficient attention to gender perspectives in media and communication policies also had to be addressed.

6. While the preparatory process for the World Summit on the Information Society and other global and United Nations activities on ICT had highlighted the digital divide between and within countries and between rich and poor, urban and rural dwellers, young and old, and divides based on class, caste or ethnicity, little attention had so far been paid to the gender-based barriers and divides women encountered in access to and use of information and communication technologies. While most of the world's people remained without access to ICT, existing gender inequalities had made it even more difficult for women to gain such access. Participants identified the gender dimensions of a number of barriers, including those relating to the lack or inadequacy of infrastructure, costs, poverty and resources, literacy and educational levels and language.

7. In addition to access, participants emphasized the need to clarify women's information needs and to address questions of content available through the media and new technologies. Participants noted that information and communication technologies were tools that had to be integrated into women's lives rather than being pursued for their own sake. They should be adapted to women's needs and made part of all programmes, for example those aimed at enhancing women's education or health. Much of the information presently available through ICT was in English, and thus of limited relevance and use to the majority of women. This made it imperative to support the production of local content in local languages. Organizations that produced such local content aimed at the empowerment of women especially deserved assistance. Participants also called for research on women's information needs.

8. Many participants emphasized the importance and continuing usefulness of "old", traditional media and technologies, especially those that were not text-based, as tools for the empowerment of women. Women's initiatives in the area of community, traditional and alternative media should be recognized, supported and strengthened. Community radio was cited as an example and as a vital link for disseminating local information to communities not sufficiently served by other national media. Radio in particular was a means for poor women, especially in rural areas, to obtain information and to increase knowledge, and was considered by some to be a more useful tool than other technologies, especially in the short term.

9. Participants were concerned that little progress had been made in improving the trend of women's employment in the media, especially at the decision-making level. Issues such as high attrition rates of women in media professions worldwide required a range of measures, including the setting of goals and targets and the adoption of gender-sensitive policies in human resources management. The information society offered many new economic opportunities for women, but women had to overcome numerous barriers to take advantage of them. Unfavourable established patterns of women's employment were already being replicated in the field of ICT, where women were increasingly found in low-paying jobs. Participants called for measures to promote women's economic participation in the information society. Greater numbers of women and girls in science and technology were a critical prerequisite for ensuring that women not only acquired access to ICT, but also gained more control over such technologies and their production.

10. The changing environment in the global media and communication systems and the rapid developments in the ICT sector increased the urgency to integrate gender perspectives into legislation, policies and regulatory frameworks related to those sectors. So far, most national ICT policies, plans and programmes paid no attention to gender perspectives and were silent on women's priorities and needs. Gender analysis had to be undertaken at all stages of policy and programme development, from their initial design to implementation, monitoring and evaluation. Political will and leadership had been decisive in a number of countries to strengthen attention to gender perspectives in national ICT policies. An increase in financial resources was needed to improve infrastructure and increase women's access to ICT.

11. Participants called for the collection of data disaggregated by sex on the use of and access to ICT and the media in order to create a solid basis for informed policy-making. Apart from quantitative data, qualitative gender-specific indicators on various aspects of ICT use, access and dissemination, as well as on women's information needs, had to be compiled so that targeted responses could be developed. The establishment of measurable targets and benchmarks for gender equality in ICT was also recommended.

12. The work of the Economic and Social Council had been instrumental in putting ICT for development on the agenda of the United Nations. This work was of an inclusive and participatory nature that involved the contribution of all stakeholder groups. The United Nations ICT Task Force was based on a multi-stakeholder approach that involved Governments, the private sector and civil society and that included gender equality as one of its goals. A number of the most interesting and promising activities spearheaded by the working groups of the Task Force were women's projects.

13. Participants provided examples of good practices and shared ideas for enhancing the role of the media and ICT in the promotion of gender equality and women's empowerment. Awards for positive, non-sexist portrayals of women in the media were seen as an excellent incentive, but measures were also needed to ensure institutional adherence to non-sexist portrayals within media organizations. Incentive systems of different types could be pursued, and voluntary codes of conduct and guidelines on gender-sensitive and non-sexist reporting should be encouraged. Efforts were necessary to achieve adequate coverage in the media and ICT of women in political and leadership positions, especially also during election campaigns, as inadequate coverage of women by the media had been shown to be directly related to their underrepresentation in political office. Partnerships between government and civil society organizations helped in increasing women's access to ICT.
