Replies to the Second Questionnaire on the status of
implementation of time "T"
(TSB Circular 196 of 11 June 1999)

ITU-T Recommendation E.164 (The International Public Telecommunication Numbering Plan) details the format and structure of the public switched telephone network (PSTN) numbering plan. This Recommendation states that all switches and networks should have the capability of handling international telephone numbers up to a maximum length of 15 digits and analysing up to 7 digits. Previously, the maximum digit length was 12 digits with the digit analysis of up to 5 digits.

Through TSB Circular 196 of 11 June 1999, the Telecommunication Standardization Bureau sent a questionnaire to all Administrations on the status of implementation of time "T".

The following valid replies have been received.

1)   10% of local carriers do not allow subscribers to dial up to 15 digits.

2)   It is not envisaged in the short term to analyse the first seven digits of the international number. This case has not presented itself.

3)   The capability to analyse the first 7 digits will be implemented shortly.

4)   The capability to analyse the first 7 digits could be implemented when all correspondents furnish us with the details of their numbering plan.

5)   For IVPN, the N(S)N is up to 14 digits.

6)   In Turkish telecommunication networks, the public switched telephone network (PSTN), international exchanges and most of the digital exchanges have the capability of handling international numbers up to maximum length of 15 digits and have the capability of analysing the first 7 digits of international numbers. But some rural exchanges and electromechanical exchanges do not have this capability.

7)   Regarding the end-to-end call, concerning the capability to analyse 7 digits, it depends on the capability of the originating network.

8)   For a few exceptions, the N(S)N is composed of 9 digits.
