

## RECOMMENDATION ITU-R SA.1160-1

**INTERFERENCE CRITERIA FOR DATA DISSEMINATION AND DIRECT  
DATA READOUT SYSTEMS IN THE EARTH EXPLORATION-SATELLITE AND  
METEOROLOGICAL-SATELLITE SERVICES USING SATELLITES  
IN THE GEOSTATIONARY ORBIT**

(Question ITU-R 141/7)

(1995-1997)

The ITU Radiocommunication Assembly,

*considering*

- a) that interference criteria are needed to ensure that systems can be designed to achieve adequate performance in the presence of interference;
- b) that interference criteria may be determined using the methodology described in Recommendation ITU-R SA.1022 and the performance objectives listed in Recommendation ITU-R SA.1159;
- c) that interference criteria assist in the development of criteria for sharing bands among systems, including those operating in other services;
- d) that systems in the Earth exploration-satellite (EES) and meteorological-satellite (METSAT) services must specify interference thresholds at levels greater than or equal to the permissible levels;
- e) that Annex 1 presents the parameters of representative systems that provide the basis for permissible levels of interference for pertinent transmissions in the EES and METSAT services,

*recommends*

- 1 that the interference levels specified in Table 1 be used as the permissible total levels of interfering signal power at the antenna output of stations operating in the EES and METSAT services.

TABLE 1

**Interference criteria for stations in the EES and METSAT services  
using spacecraft in the geostationary orbit**

Frequency band (MHz)	Function and type of earth station	Interfering signal power (dBW) in the reference bandwidth to be exceeded for no more than 20% of the time	Interfering signal power (dBW) in the reference bandwidth to be exceeded for no more than $p\%$ of the time
1 670-1 710	Direct data readout, high gain antenna	-150.7 dBW per 2.6 MHz	-150.1 dBW per 2.6 MHz $p = 0.025$
	Data dissemination, low gain antenna	-162.4 dBW per 4 kHz	-159.8 dBW per 4 kHz $p = 0.025$
	Data dissemination, high gain antenna	-145.3 dBW per 2.11 MHz	-144.7 dBW per 2.11 MHz $p = 0.025$
25 500-27 000	Direct data readout, 60.1 dBic antenna	-128 dBW per 10 MHz <sup>(1)</sup>	-119.1 dBW per 10 MHz <sup>(1)</sup> $p = 0.25$

*Notes to Table 1:*

(<sup>1</sup>) The interfering signal powers (dBW) in the reference bandwidths are specified for reception at elevation angles  $\geq 5^\circ$ .

NOTE 1 – The interfering signal powers (dBW) in the reference bandwidths are specified for reception at elevation angles  $\geq 3^\circ$ .

NOTE 2 – The total interfering signal power level that may be exceeded for no more than  $x\%$  of the time, where  $x$  is less than 20% but greater than the specified short-term time percentage ( $p\%$  of the time), may be determined by interpolation between the specified values using a logarithmic scale (base 10) for percentage of time and a linear scale for interfering signal power density (dB).

NOTE 3 – Using the guidelines in Recommendation ITU-R SA.1022, the permissible levels of interference may be scaled for application to stations with antenna gain or bandwidth values that differ from the specified values.

NOTE 4 – Although the interference criteria are based on the systems described in Annex 1, the interference criteria apply to all systems that operate in the subject frequency bands and which provide the specified service functions.

**ANNEX 1****Basis for interference criteria**

This Annex presents the parameters used as inputs to the methodology described in Recommendation ITU-R SA.1022 to determine the interference criteria. Tables 2 and 3 summarize these parameters for different types of transmission.
