Procedure in BRSIS Validation

New feature for validating resubmission notices

BRSIS Validation includes a new feature for validation of notification resubmission with update of coordination status with affected administration (A) , and notification resubmission with update of coordination status with affected administration and the list of coordination status of affected satellite networks (M). This new feature does not cover resubmission with coordination status of affected satellite networks (L) at notice level.

This new validation feature is to ensure that the correct database has been used to create the resubmission notice. Therefore, it checks that the group ids of the resubmission notice is the same as the group ids of the notice published in Part III-S.

When validating these two types of resubmission notice A and M, select the database containing the specific Part III-S publication of the satellite notice in status 19 which have been used to create the resubmission notice.

It is recommended that you use the appropriate IFIC database that contains the Part III-S information of the space station or download the space station's Part-IIIS database from the dedicated SNS Online site for this purpose (https://www.itu.int/sns/notification.html).
