

# Graph Neural Networks for Physical Networks Modeling

ITU-ML5G-PS-014

Loïck Bonniot   Christoph Neumann   François Schnitzler   François Taïani

## Applications:

- SDN optimization
- 5G networks  
"ML-based QoE optimization" [ITU-T, 2019]

“RouteNet” [Rusek et al., 2019] baseline provided

- Message-passing Graph Neural Network (GNN)
- Models hidden states of **paths** and **links**
- Resolves circular dependencies using **fixed-point** convergence

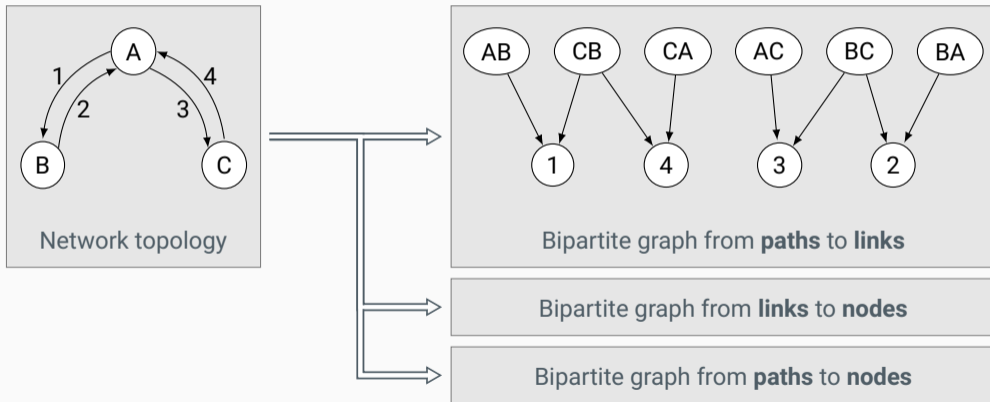

✗ Node states?

✗ QoS policies?

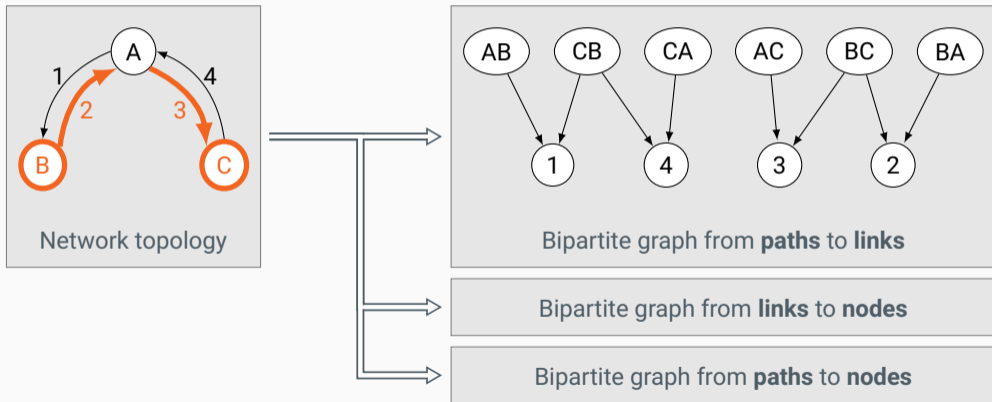

- ⇒ Add **nodes** hidden states to model QoS
- ⇒ Transform network topologies into **3 bipartite graphs** for GNN convolutions

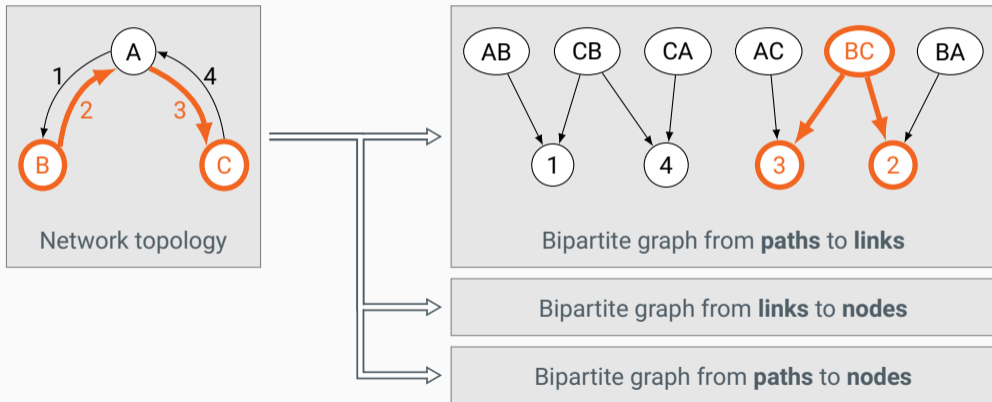

- ⇒ Add **nodes** hidden states to model QoS
- ⇒ Transform network topologies into **3 bipartite graphs** for GNN convolutions

- ⇒ Add **nodes** hidden states to model QoS
- ⇒ Transform network topologies into **3 bipartite graphs** for GNN convolutions

- ⇒ Add **nodes** hidden states to model QoS
- ⇒ Transform network topologies into **3 bipartite graphs** for GNN convolutions

Demo!

- Improved **graph modelization** and hidden-state **convergence**
- Custom strategy for **hidden state aggregation**
- Demo: [gnnet.interdigital.com](http://gnnet.interdigital.com)
- Source-code available upon request  
(contact [christoph.neumann@interdigital.com](mailto:christoph.neumann@interdigital.com))

**The graph neural network model.**  
*IEEE Transactions on Neural Networks*, 20(1):61–80.

$$\mathbf{x}'_{i,t+1} = \gamma \left( \mathbf{x}_{i,t}, \square_{j \in \mathcal{N}(i)} \phi(\mathbf{x}_{j,t}) \right)$$

- $\mathbf{x}_{i,t}$  “destination” embeddings
- $\mathbf{x}_{j,t}$  “source” embeddings
- $\mathcal{N}(i)$  neighbors of  $i$  in graph = list of “sources”  $j$  leading to “destination”  $i$
- $\gamma$  and  $\phi$  are trained perceptrons
- $\square$  is the **aggregation** function
  - Min, Max, Mean, etc. when neighbors are **unordered** (e.g. links to nodes)
  - RNN when neighbors are **ordered** (e.g. paths to nodes)

- Preprocessing: pandas dataframe, standardization
- Model rewritten completely in Pytorch + Pytorch-geometric
- Embeddings size: 400, leading to 11 465 185 parameters
- Adam Optimizer with CyclicLR Scheduler; no regularization
- $\approx$  1 week of training on single Tesla M60 GPU
