IoT and AI Applications and Services: Key Regulatory Aspects from an Information Security Perspective

Dr. Ramy Ahmed Fathy, PhD

Director of Digital Services Policies & Planning, NTRA Co-Chairman of ITU-T WP1/20 Vice Chairman of ITU-T SG20 "IoT and its Applications including SC&C"

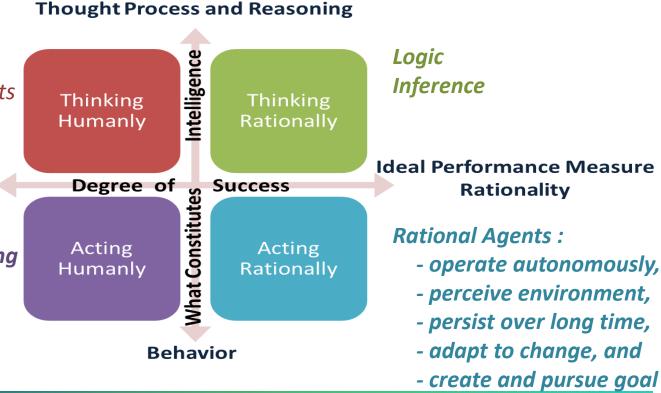

Artificial Intelligence – Features/Apps/Services

Cognitive Neuroscience Introspection

- Psychological Experiments
- Brain Imaging

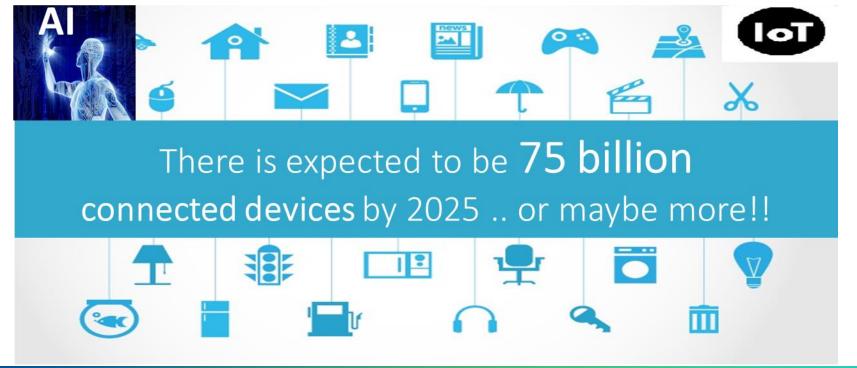

Fidelity to Human
Performance

Natural Language Processing knowledge Representation Automated Reasoning Machine Learning

Global economic impact of IoT exceeds 10 trillion USD per year in 10 years while AI promises around 13 trillion USD (that's 1.2% additional GDP growth per year).

IoT applications and services have positive effects on cost savings, revenues, and operational efficiencies.. True.. Opportunites gets better by adding AI .. True.. But not without disclaimers!

-	$\lceil + \not$	7 I P	'n	mis	PS
	, , , , , , , , , , , , , , , , , , ,	71 1			U J

Only IFs

New revenue streams for businesses

Policies Support It

Cost savings in a wide no. of industries (operational efficiencies)

Regulations Allow it

Prediction capabilities (for businesses, individuals, and gov.)

Standards are in Place

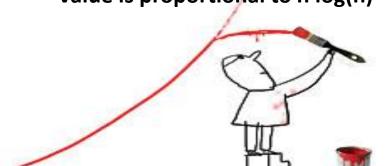

Very good Sci-Fi movies ☺

Good Movie Producers ©

Metcalfe's Law is Wrong!

The value of a communications network is proportional to the square of the number of "We are in great haste to construct a magnetic its users Value is proportional to n log(n)

telegraph from Maine to Texas; but Maine and Texas, it may be, have nothing important to communicate."

Henry David Thoreau in Walden (1854).

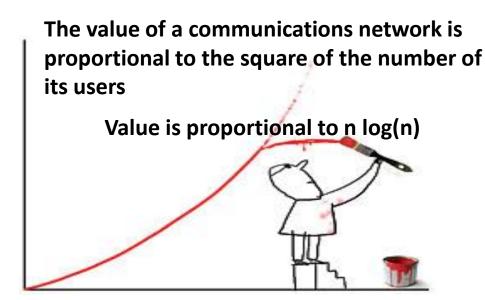

The fundamental flaw underlying Metcalfe's (and similar laws like Reed's is in the assignment of equal value to all connections or all groups.

Jul. 2006

Metcalfe's Law is Wrong!

Connectivity might not be the one and only value driver!

Many ingredients like expected performance, expected effort exerted (ease of use), trust,...etc.

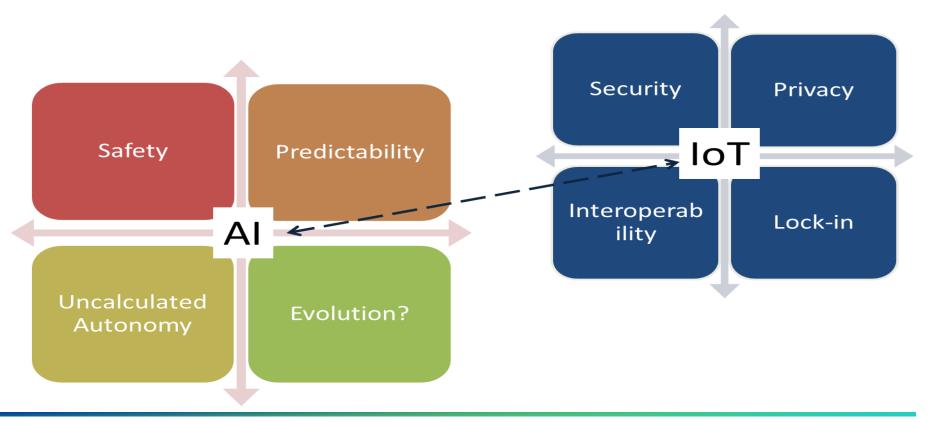

Issues Coming Up!

- IoT: Notions of security, privacy (data), cloud security, interoperability, lock-in, identification were all coming in.
- Blockchain: Notions of anonymity, accountability, decentralized platform, smart contracts, permissioned vs. permission-less ledgers + money laundry issues (bitcoin and similar digital currencies)
- AI: Notions of autonomy, accountability, unknown behavior, & unpredictability will pop up + which AI paradigm are we trying to adopt? → mistrust.
 - New regulatory tools are needed for security, and safety checks are needed

There are eight major domains of risk associated with AlloT!

Can Security help?

Confidentiality

Fidelity

Availability

Trust

Non Repudiation

Authentication

Authorization

Reasons for Trust

PEDICTABILITY

The degree to which a person meets the expectations of the trustor in terms of reliability and consistence of behavior

Cognitive Trust (Schumann et al.)

INTEGRITY

The intrinsic moral norms of a trustee to guard his actions with (e.g. sincerity, discretion, honesty) Results from deliberate assessment of other's characteristics and the process to weighing benefits of trusting over risks

ABILITY

Capability of a trustee (based on knowledge, competence, and skills) to perform tasks within a specific domain

Tripod Model (Mayer et al.)

BENEVOLENCE

The perceived level of courtesy and positive attitude

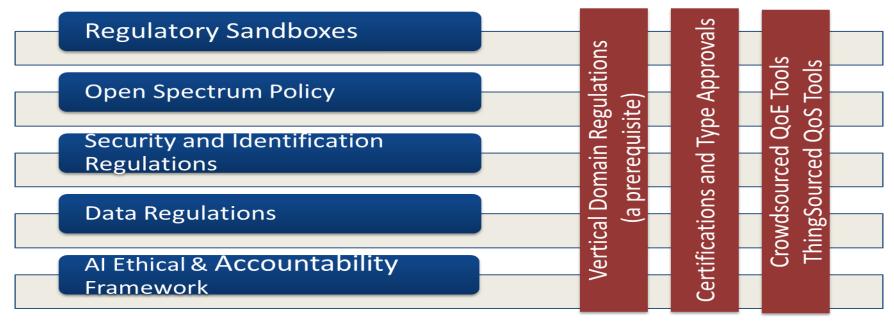

Affective Trust (Schumann et al.)

Involves one's emotional bonds and sincere concern for the well being of the others

Adapted from Fabio Calefato et al. (2015)

What type of measures could the industry do to reap the value of AlloT and avoid the risks?

Thingsourced QoS Tools: things collaborating together and reporting back on QoS of IoT connectivity.

Examples of Key Questions/Possible Regulatory Measures..

- Is the device capable of receiving security related updates? if yes, is it automatically?
- Are PII stored, processed, and transferred securely? How?
- Authentication by default, including unique system generated one time passwords.
- Implement measures to help prevent physical tampering of devices.
- Systems and solutions deployed should be standardized to ensure security, interoperability, and standard interfaces and protocols adoption (Industry specific).
- Do AI communities/industry groups have an ethical framework to govern their work? published? audited? How?

Thank you
