

**"The DTT roadmap"** by Jean-Pierre Faisan, Vice-chair Broadcast Networks Europe

Digital Terrestrial TV (DTT) is firmly established in practically all European countries serving primary or secondary TV-sets in almost 50% of European households. DTT secures European values and underpins the content production and audio-visual industry. The recent EU UHF decision provides clear regulatory visibility for its access to spectrum until at least 2030.

The DTT platform is quickly evolving and innovating to operate on 30% less spectrum while delivering an improved user experience including new image and sound formats and increased interactivity. In parallel, there will be important regulatory milestones, including WRC-23, while new technologies may provide additional opportunities to complement existing services.

Our strong view is that DTT networks with their unique characteristics will remain as a leading distribution platform well beyond 2030.
