

The complexity of modern life requires different approaches to different problems and seems to be being repeated by the needs related to DLT technology.

It seems unlikely that only one DLT technology will be able to address the different problems that are being put to use.

Is the versatility of technology one of its great attractions?

Often focused on different niches technology developers have been bringing the most varied structural approaches facilitating the solution of their use cases but questioning how we can connect such different technologies to each other.

Multiledgers technology demonstrates how we can use smart contracts to securely integrate different types of DLT technology.

Utilizing their proprietary smart contracts integrating different cloud providers and DLT technologies providing simple interoperability at different levels.

Much remains to be done in this regard and Multiledgers stands as one of several possible solutions bringing in a simple way to decentralized reliability for data exchange.
