

# Thriving in Harmony

*Making the economic case for  
frequency harmonisation in Europe*

**Dr. Klaus-D. Kohrt**

**Vice-Chairman, UMTS Forum**

# The spectrum debate is considering whether the concerns levelled at harmonisation can be addressed by a more liberalised approach

## Overview of Spectrum Debate

Benefits of Harmonisation	Concerns over Harmonisation
<ul style="list-style-type: none"><li>▶ Minimises harmful interference and promotes spectrum efficiency and so increases spectrum use and competition</li><li>▶ Allows global circulation (mobility of terminals) and roaming</li><li>▶ Creates large equipment markets</li><li>▶ Promotes price competition between suppliers</li><li>▶ Ensures radio service penetration and interoperability between terminals and other networks – the “network effect”</li><li>▶ Promotes independent competition between market players at every layer of the architecture (network, end-user services and application suppliers)</li><li>▶ Allows more dynamic growth trajectory in the introduction of new end-user services</li><li>▶ Focuses R&amp;D investment due to stable environment</li></ul>	<ul style="list-style-type: none"><li>▶ Restrictions on use (or trade) of underused spectrum for alternative uses</li><li>▶ Restrictions on the ability to re-farm spectrum</li><li>▶ Insufficient spectrum allocated to some end-user services</li><li>▶ Delays caused by time to agree harmonisation measures</li><li>▶ Restrictions on the use of equipment developed elsewhere, which may be cheaper or have greater functionality</li><li>▶ Less innovation and lock-in to a potentially inferior mandated standard</li><li>▶ Delays in the introduction of new services and equipment due to the time to agree standards and agree harmonisation measures</li><li>▶ Less flexibility in support of spectrum access for new market entrants</li></ul>

## Goals of Study

- ▶ Provide the end-to-end view on this complex debate
- ▶ Assist the regulatory process with a differing perspective to that of liberalisation as a key driver for continued European market success and prosperity

# The analysis compares two alternative spectrum proposition scenarios

## Alternative Spectrum Use Proposition Scenarios – Definitions

### Spectrum Harmonisation

- ▶ Pro-active regulatory approach to manage access to spectrum bands with defined requirements
- ▶ Dedicated bands linked to defined radio services nationally, regionally or globally
- ▶ Designated group of technology standards required for the use of a particular band (also nationally, regionally or globally)

Basecase for analysis

### Spectrum Liberalisation

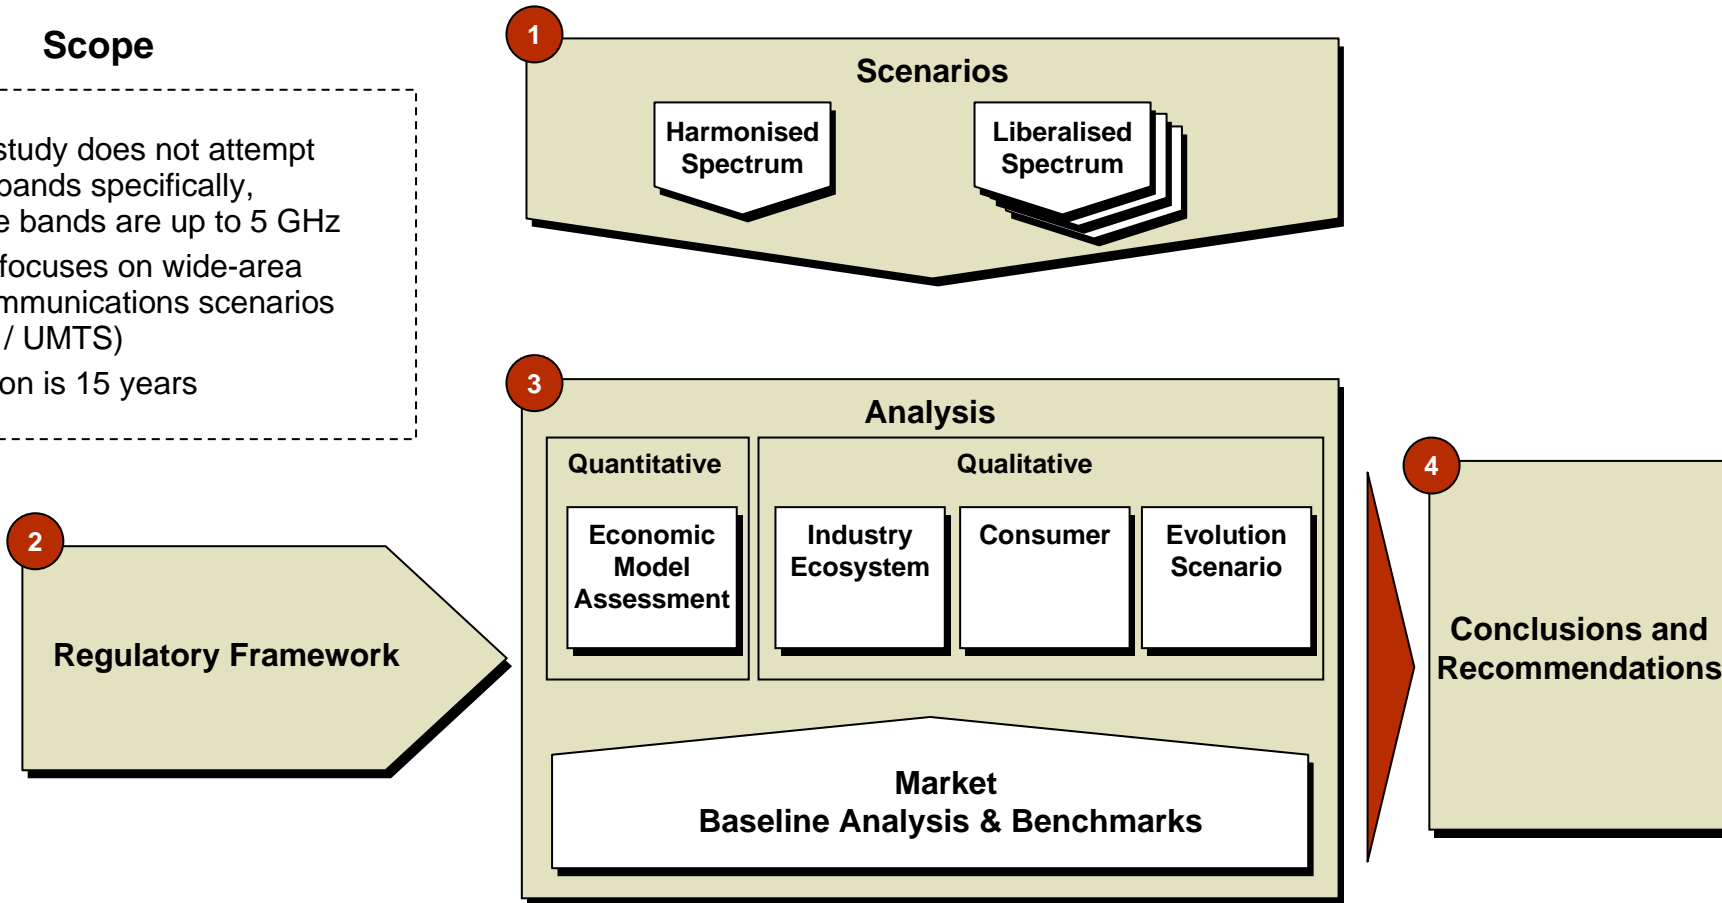

- ▶ Re-active, market-driven approach to spectrum management
- ▶ Spectrum is liberally licensed to users with little or no pre-conditions
- ▶ Technology agnostic: total freedom on technology “generalised technology neutrality” (nationally or regionally)

Spectrum Liberalisation Case (including a sensitivity analysis of penetration of new end-user services)

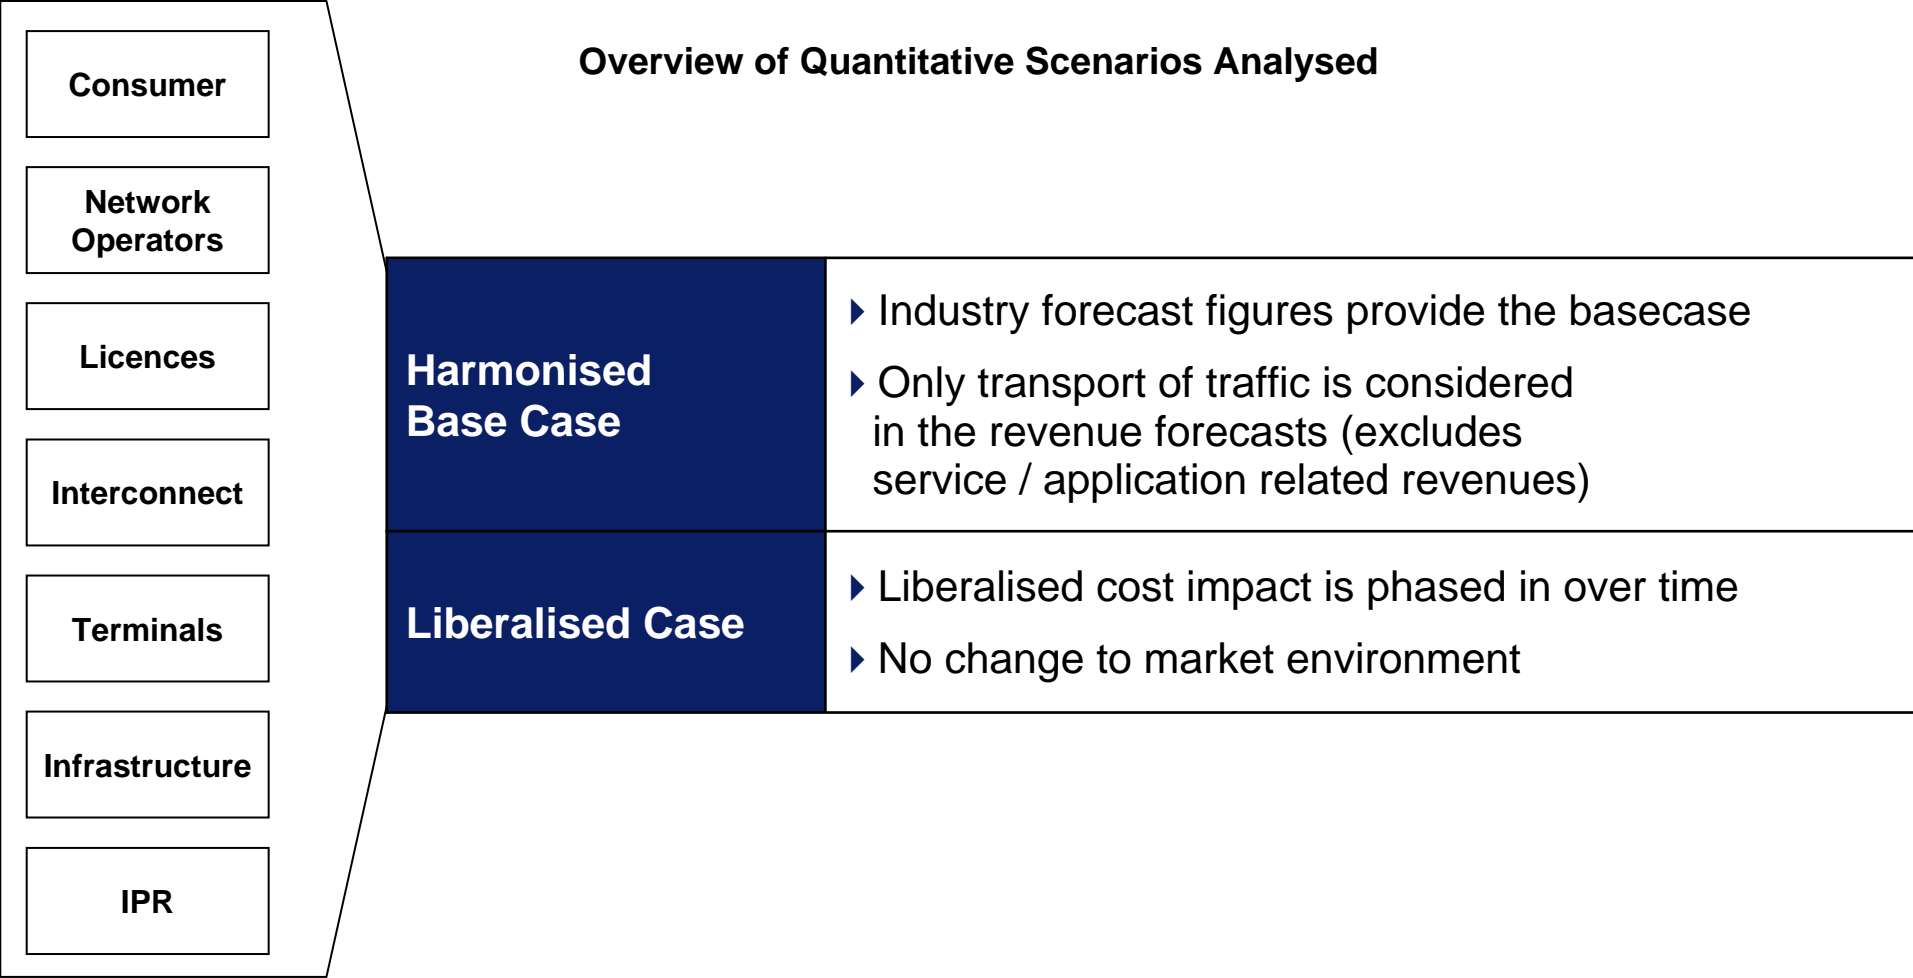

# The spectrum use proposition analysis contains four components

## Scope

- ▶ While the study does not attempt to identify bands specifically, appropriate bands are up to 5 GHz
- ▶ The study focuses on wide-area cellular communications scenarios (e.g. GSM / UMTS)
- ▶ Time horizon is 15 years

# The qualitative assessment of the eco-system provides the input to the scenario analysis

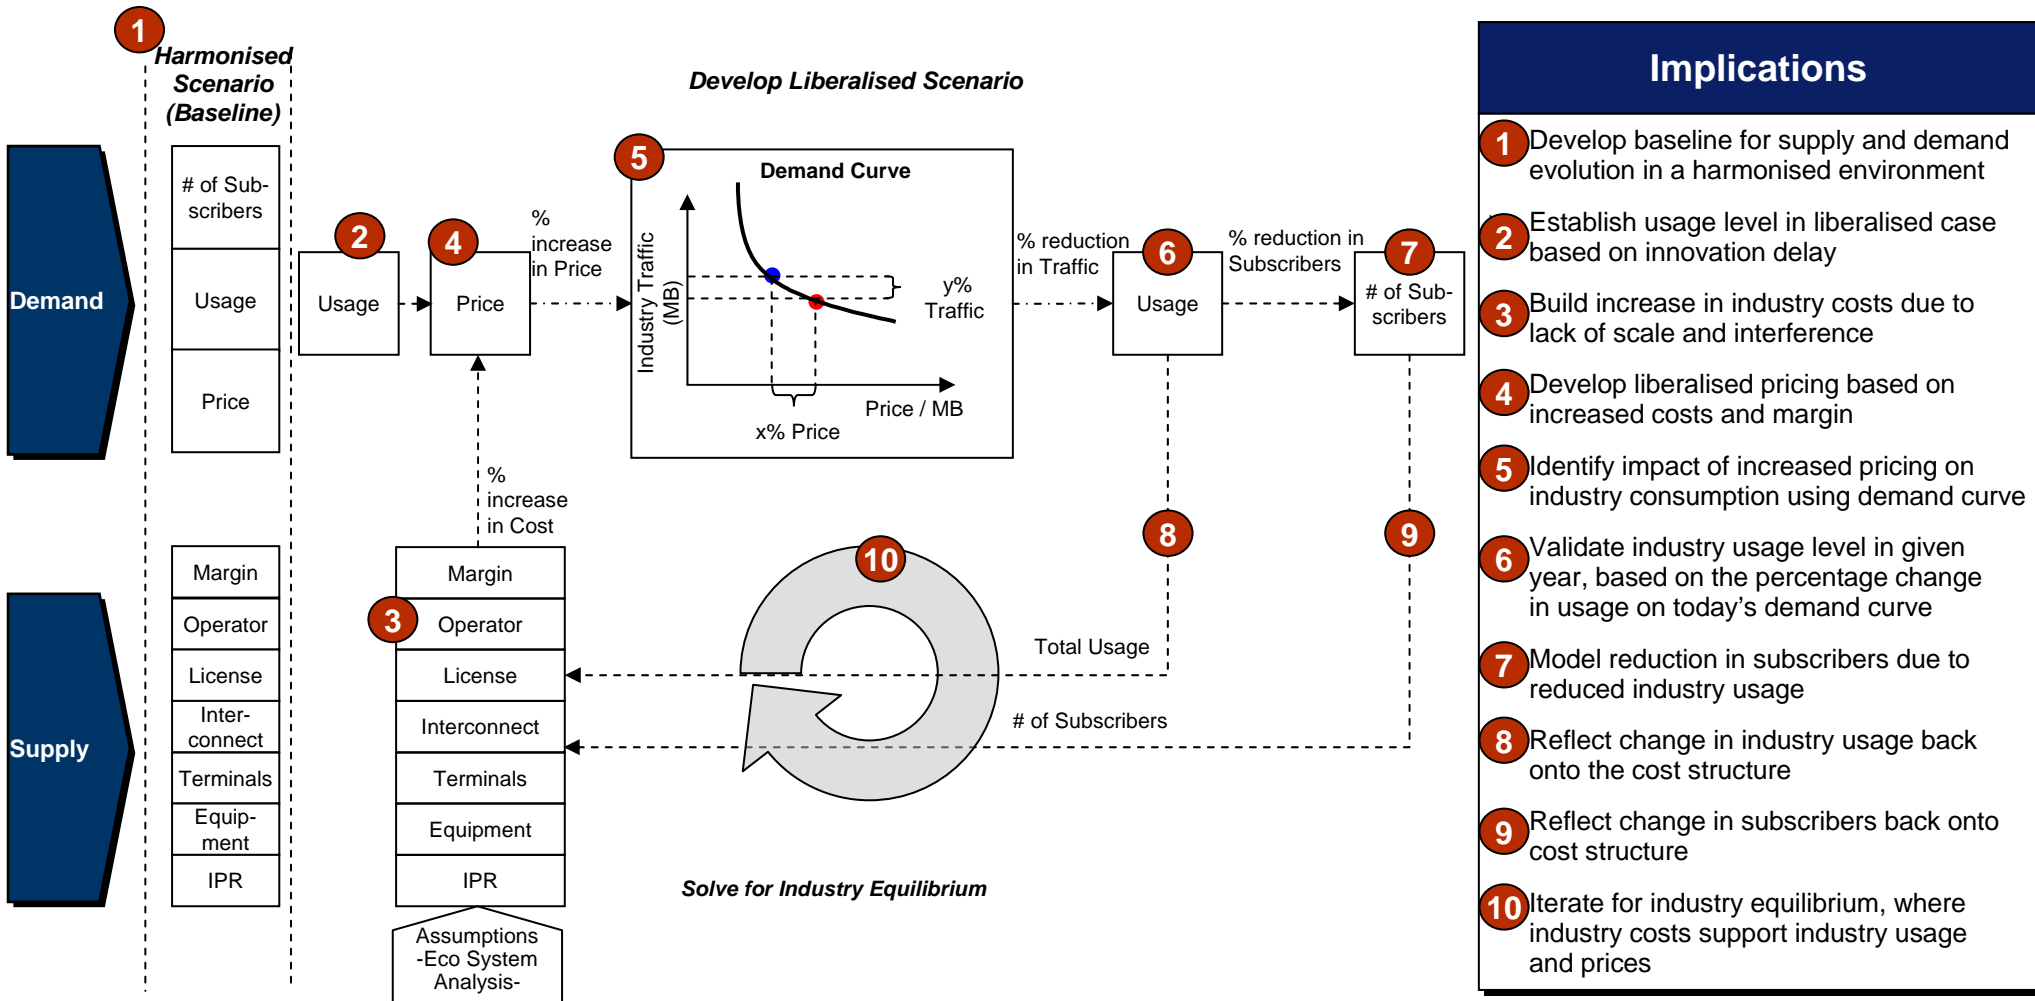

# The analysis considers the key constituents of the industry value chain

## Overview of Industry Value Chain

<b>Consumer</b>	<ul style="list-style-type: none"><li>▶ Determines the overall value of the eco-system through usage, price-paid and penetration</li></ul>	<b>Consumer Analysis</b>
<b>Network Operators</b>	<ul style="list-style-type: none"><li>▶ Value captured by operators to provide services to end-users, either directly, or via indirect channels (e.g. MVNOs and service providers)</li><li>▶ Only the network environment is considered, as the focus of the study is the radio layer</li></ul>	
<b>Licences</b>	<ul style="list-style-type: none"><li>▶ Value of spectrum captured by governments</li><li>▶ Licences are considered to apply in both scenarios</li></ul>	
<b>Interconnect</b>	<ul style="list-style-type: none"><li>▶ Value associated with transit of traffic and termination of traffic on non-mobile networks</li></ul>	<b>Industry Ecosystem Analysis</b>
<b>Terminals</b>	<ul style="list-style-type: none"><li>▶ Value of end-user terminals, captured by terminal vendors</li></ul>	
<b>Infrastructure</b>	<ul style="list-style-type: none"><li>▶ Value of network infrastructure, captured by network infrastructure vendors</li></ul>	
<b>IPR</b>	<ul style="list-style-type: none"><li>▶ Mechanism to recuperate R&amp;D investments – either captured via IPR royalties or infrastructure / terminal sales for traditional manufacturers</li></ul>	

# The quantitative scenario analysis employs the Extended Intelligent Simulation Methodology

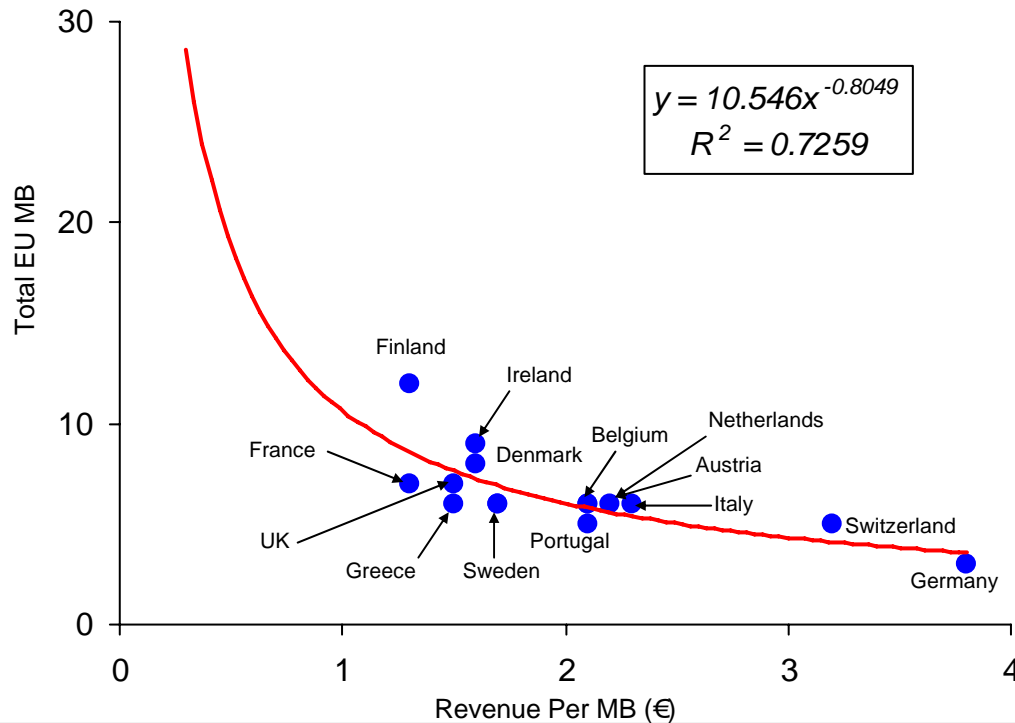

# The consumer impact of liberalisation is modelled using a mobile industry demand curve for Western Europe

## Mobile Industry Demand Curve

### Overview

#### Demand Curve

-Total EU MB usage per month vs. Revenue per MB-

### Comments

- ▶ A range of countries across the European-15 countries have been used to establish a demand curve that is used to model the effects of changing price on usage
- ▶ The gradient of the demand curve is assumed to remain constant throughout the analysis period
- ▶ It is anticipated that the demand curve will move upward over time – i.e. as the market develops and new end-user services are brought to market the usage level for any given price point will increase over time
- ▶ The modelling approach will compensate for this effect by using the percentage change in usage at any price point to drive the model

(1) Note: IDC, 2006, Booz Allen Hamilton analysis

# The liberalised case – detailed results compared to the harmonised base case

## Summary

**EU-15 – Liberalised Case Network Cost – Compared to Harmonised Basecase –**

**EU-15 – Liberalised Case Consumer Revenue<sup>1)</sup> – Compared to Harmonised Basecase –**

## Breakdown

**EU-15 – Liberalised Case Subscribers – Compared to Harmonised Basecase –**

**EU-15 – Liberalised Case Monthly Usage / Sub – Compared to Harmonised Basecase –**

**EU-15 – Monthly ARPU – Normalized to 2006 Prices –**

**EU-15 – Liberalised Case Price / MByte – Compared to Harmonised Basecase –**

(1) Note: Inflation is included

# The economic scenario analysis indicates a tangible upside for the harmonised case, based on consumers and overall industry benefits

## Impact of Liberalised Scenarios Compared to Harmonised Baseline

	Consumer Indices				Industry / Consumer Ecosystem Indicators		
<b>Liberalised Case</b> (Variation in absolute terms compared to Harmonised Case)	Usage / Sub <sup>1)</sup> -3%	ARPU <sup>1)</sup> 7%	Penetration <sup>1)</sup> -5%	Consumer Surplus <sup>2)</sup> -€244 bn (-5%) <sup>3)</sup>	Consumer Revenue <sup>1)</sup> 2%	Industry Usage <sup>4)</sup> -7%	Industry Cost <sup>5)</sup> 17%
<b>Liberalised Case</b> (Variation in growth from 2006 compared to Harmonised Case)	Usage / Sub <sup>1)</sup> -3%	ARPU <sup>1)</sup> 10%	Penetration <sup>1)</sup> -37%	Consumer Surplus <sup>2)</sup> -€244 bn (-5%) <sup>3)</sup>	Consumer Revenue <sup>1)</sup> 3%	Industry Usage <sup>4)</sup> -7%	Industry Cost <sup>5)</sup> 23%

(1) Note: Percentage change compared to harmonised basecase by 2021

(2) Note: Consumer Surplus shows the cumulative change in consumer surplus compared to basecase over 15 years (2006 -2021)

(3) Note: Consumer Surplus as percentage of scenario consumer revenue over 15 years (2006 -2021)

(4) Note: Industry usage shows the percentage change in mobile industry traffic level, in the EU-15 by 2021, compared to the harmonised basecase

(5) Note: Industry cost shows the percentage change in mobile industry cost level, in the EU-15 by 2021, compared to the harmonised basecase

# Overall, the quantitative and qualitative assessments favours the continuation of the harmonised approach to spectrum management

## Quantitative Results

- ▶ Harmonisation provides a greater benefit to consumers than liberalisation
  - 3% greater usage per subscriber
  - 5% higher in end-user service penetration
  - €244bn greater consumer surplus over the 15 year analysis period
- ▶ Harmonisation has a superior cost position: the cost structure of the industry eco-system is 17% lower than the liberalised case
- ▶ Considering the impact of a delay in the introduction of new end-user services on the liberalised case, results in further upside in favour of harmonisation, which includes: 8% greater usage per subscriber and 4% less mobile industry revenue compared to the liberalised scenario

## Qualitative Results

### ***Consumer Benefits***

- ▶ More rapid introduction of new innovations
- ▶ Increased service continuity and cross-boarder roaming
- ▶ Greater penetration of new end-user services

### ***Industry Eco-system Benefits***

- ▶ Increased financial stability encouraging investment
- ▶ Increased industry scale – enabling lower industry cost structure
- ▶ Reduced interference management costs
- ▶ Layered architecture stimulating new entrants and competitive dynamics
