## Versatile supplemental enhancement information messages for coded video bitstreams

### Summary

Recommendation ITU-T H.274 specifies the syntax and semantics of video usability information (VUI) parameters and supplemental enhancement information (SEI) messages for use with coded video bitstreams. The VUI parameters and SEI messages defined in this Recommendation may be conveyed within coded video bitstreams in a manner specified in a video coding specification or may be conveyed by other means as determined by the specifications for systems that make use of such coded video bitstreams. This Recommendation is particularly intended for use with coded video bitstreams as specified by Rec. ITU-T H.266 | ISO/IEC 23090-3, although it is drafted in a manner intended to be sufficiently versatile and generic that it may also be used with other types of coded video bitstreams.

This Recommendation was developed collaboratively with ISO/IEC JTC 1/SC 29, and corresponds with ISO/IEC 23002-7 as technically aligned twin text.

### History

Edition	Recommendation	Approval	Study Group	Unique ID*

## FOREWORD

The International Telecommunication Union (ITU) is the United Nations specialized agency in the field of telecommunications, information and communication technologies (ICTs). The ITU Telecommunication Standardization Sector (ITU-T) is a permanent organ of ITU. ITU-T is responsible for studying technical, operating and tariff questions and issuing Recommendations on them with a view to standardizing telecommunications on a worldwide basis.

The World Telecommunication Standardization Assembly (WTSA), which meets every four years, establishes the topics for study by the ITU-T study groups which, in turn, produce Recommendations on these topics.

The approval of ITU-T Recommendations is covered by the procedure laid down in WTSA Resolution 1.

In some areas of information technology which fall within ITU-T's purview, the necessary standards are prepared on a collaborative basis with ISO and IEC.

## NOTE

In this Recommendation, the expression "Administration" is used for conciseness to indicate both a telecommunication administration and a recognized operating agency.

Compliance with this Recommendation is voluntary. However, the Recommendation may contain certain mandatory provisions (to ensure, e.g., interoperability or applicability) and compliance with the Recommendation is achieved when all of these mandatory provisions are met. The words "shall" or some other obligatory language such as "must", and the negative equivalents are used to express requirements. The use of such words does not suggest that compliance with the Recommendation is required of any party.

## INTELLECTUAL PROPERTY RIGHTS

ITU draws attention to the possibility that the practice or implementation of this Recommendation may involve the use of a claimed Intellectual Property Right. ITU takes no position concerning the evidence, validity or applicability of claimed Intellectual Property Rights, whether asserted by ITU members or others outside of the Recommendation development process.

As of the date of approval of this Recommendation, ITU had received notice of intellectual property, protected by patents, which may be required to implement this Recommendation. However, implementers are cautioned that this may not represent the latest information and are therefore strongly urged to consult the TSB patent database at <http://www.itu.int/ITU-T/ipr/>.

## Versatile supplemental enhancement information messages for coded video bitstreams

### 1 Scope

This Recommendation | International Standard specifies the syntax and semantics of video usability information (VUI) parameters and supplemental enhancement information (SEI) messages. The VUI parameters and SEI messages defined in this Specification are designed to be conveyed within coded video bitstreams in a manner specified in a video coding specification or to be conveyed by other means determined by the specifications for systems that make use of such coded video bitstreams. This Specification is particularly intended for use with coded video bitstreams as specified by Rec. ITU-T H.266 | ISO/IEC 23090-3, although it is drafted in a manner intended to be sufficiently generic that it can also be used with other types of coded video bitstreams.

VUI parameters and SEI messages can assist in processes related to decoding, display or other purposes. However, unless otherwise specified in a referencing specification, the interpretation and use of the VUI parameters and SEI messages specified in this Specification is not a required functionality of a video decoder or receiving video system. Although semantics are specified for the VUI parameters and SEI messages, decoders and receiving video systems can simply ignore the content of the VUI parameters and SEI messages or can use them in a manner that somewhat differs from what is specified in this Specification.

### 2 Normative references

The following Recommendations and International Standards contain provisions which, through reference in this text, constitute provisions of this Recommendation | International Standard. At the time of publication, the editions indicated were valid. All Recommendations and Standards are subject to revision, and parties to agreements based on this Recommendation | International Standard are encouraged to investigate the possibility of applying the most recent edition of the Recommendations and Standards listed below. Members of IEC and ISO maintain registers of currently valid International Standards. The Telecommunication Standardization Bureau of the ITU maintains a list of currently valid ITU-T Recommendations.

#### 2.1 Identical Recommendations | International Standards

- None

#### 2.2 Paired Recommendations | International Standards equivalent in technical content

### 3 Definitions

For the purposes of this Recommendation | International Standard, the following definitions apply:

- 3.1 access unit (AU):** A set of *PUs* that belong to different *layers* and contain *coded pictures* associated with the same *output time*.
- 3.2 adaptation parameter set (APS):** A *syntax structure* containing *syntax elements* that apply to zero or more *slices* as determined by zero or more *syntax elements* found in *slice headers*.
- 3.3 associated IRAP picture (of a particular picture):** The previous *IRAP picture* in *decoding order* (when present) in the same *layer* as the particular *picture*.
- 3.4 azimuth circle:** A circle on a sphere connecting all points with the same azimuth value.

NOTE – An azimuth circle is always a *great circle* like a longitude line on the earth.

- 3.5 byte:** A sequence of 8 bits, within which, when written or read as a sequence of bit values, the left-most and right-most bits represent the most and least significant bits, respectively, and the bits are written or read from left to right.
- 3.6 chroma:** An adjective, represented by the symbols Cb and Cr, specifying that a sample array or single sample is representing one of the two colour difference signals related to the primary colours.  
NOTE – The term chroma is used rather than the term chrominance in order to avoid implying the use of linear light transfer characteristics that is often associated with the term chrominance.
- 3.7 coded layer video sequence (CLVS):** A sequence of *PUs* of the same layer that consists, in *decoding order*, of a *CLVSS PU*, followed by zero or more *PUs* that are not *CLVSS PUs*, including all subsequent *PUs* up to but not including any subsequent *PU* that is a *CLVSS PU*.
- 3.8 coded layer video sequence start (CLVSS) PU:** A *PU* in which the *coded picture* is a *CLVSS picture*.
- 3.9 coded layer video sequence start (CLVSS) picture:** A *coded picture* that starts a new CLVS as specified in a video coding specification.  
NOTE – In Rec. ITU-T H.266 | ISO/IEC 23090-3, a CLVSS picture is an *IRAP picture* with *NoIncorrectPicOutputFlag* equal to 1 or a gradual decoding refresh picture with *NoIncorrectPicOutputFlag* equal to 1. In Rec. ITU-T H.265 | ISO/IEC 23008-2, a CLVSS picture is an *IRAP picture* with *NoRaslOutputFlag* equal to 1.
- 3.10 coded picture:** A *coded representation* of a *picture* containing all *CTUs* of the *picture*.
- 3.11 coded slice NAL unit:** A *NAL unit* that contains a *coded slice*.
- 3.12 coded video bitstream:** A sequence of bits that forms the representation of a sequence of *AUs* forming one or more coded video sequences (*CVSs*).
- 3.13 coded video sequence (CVS):** A sequence of *AUs* that consists, in *decoding order*, of a *CVSS AU*, followed by zero or more *AUs* that are not *CVSS AUs*, including all subsequent *AUs* up to but not including any subsequent *AU* that is a *CVSS AU*.
- 3.14 coded video sequence start (CVSS) AU:** An *AU* that has a *PU* for each *layer* present in the *CVS* and the *coded picture* in each *PU* is a *CLVSS picture*.
- 3.15 component:** An array or single sample from one of the three arrays (*luma* and two *chroma*) that compose a *picture* in 4:2:0, 4:2:2, or 4:4:4 colour format or the array or a single sample of the array that compose a *picture* in monochrome format.
- 3.16 constituent picture:** A part of a spatially *frame*-packed stereoscopic *picture* that corresponds to one view, or a *picture* itself when *frame* packing is not in use or the temporal interleaving *frame* packing arrangement is in use.
- 3.17 cropped decoded picture:** The result of cropping a *decoded picture* based on the conformance cropping window for the corresponding *coded picture*.
- 3.18 decoded picture:** A *decoded picture* is derived by decoding a *coded picture*.
- 3.19 decoder:** An embodiment of a *decoding process*.
- 3.20 decoding order:** The order in which *syntax elements* are conveyed in the *coded video bitstream* and are processed by a *decoding process*.
- 3.21 decoding process:** The process that reads a *coded video bitstream* and derives *decoded pictures* from it.
- 3.22 elevation circle:** A circle on a sphere connecting all points with the same elevation value.  
NOTE – An elevation circle is similar to a latitude line on the earth. Except when the elevation value is zero, an elevation circle is not a *great circle* like a longitude circle on the earth.
- 3.23 encoder:** An embodiment of an *encoding process*.
- 3.24 encoding process:** A process that produces a *coded video bitstream*.
- 3.25 field:** An assembly of alternative rows of samples of a *frame*.
- 3.26 flag:** A variable or single-bit *syntax element* that can take one of the two possible values: 0 and 1.
- 3.27 frame:** The composition of a top *field* and a bottom *field*, where sample rows 0, 2, 4, ... originate from the top *field* and sample rows 1, 3, 5, ... originate from the bottom *field*.
- 3.28 global coordinate axes:** The coordinate axes associated with *omnidirectional video* that are associated with an externally referenceable position and orientation.

NOTE – The global coordinate axes could correspond to the position and orientation of a device or rig used for omnidirectional audio/video acquisition as well as the position of an observer's head in the three-dimensional space of the *omnidirectional video* rendering environment.

- 3.29 great circle:** The intersection of a sphere and a plane that passes through the centre point of the sphere.  
NOTE – A great circle is also known as an orthodrome or Riemannian circle.
- 3.30 inter prediction:** An aspect of the *decoding process* for a *coded picture* that makes use of data derived from the *decoding process* of one or more previously decoded *reference pictures*.
- 3.31 intra random access point (IRAP) AU:** An *AU* in which each *coded picture* is an *IRAP picture*.
- 3.32 intra random access point (IRAP) picture:** A *coded picture* starting from which all *pictures* in the same *layer* in both *decoding order* and *output order* can be decoded without first decoding any *picture* in the same *layer* earlier in *decoding order* in the *coded video bitstream*.
- 3.33 layer:** A set of *VCL NAL units* that all have a particular value of layer identifier and the associated non-VCL *NAL units*, wherein the layer identifier is a variable for which the value is specified by a video coding specification.  
NOTE – In the contexts of Rec. ITU-T H.266 | ISO/IEC 23090-3 and Rec. ITU-T H.265 | ISO/IEC 23008-2, the layer identifier is the value of the *nuh\_layer\_id* syntax element in the *NAL unit header*.
- 3.34 leading picture (of an IRAP picture):** A *picture* that is in the same *layer* as the *associated IRAP picture* and precedes the *associated IRAP picture* in *output order*.
- 3.35 local coordinate axes:** The coordinate axes having a specified rotation relationship relative to the *global coordinate axes*.
- 3.36 luma:** An adjective, represented by the symbol or subscript *Y* or *L*, specifying that a sample array or single sample is representing the monochrome signal related to the primary colours.  
NOTE – The term *luma* is used rather than the term *luminance* in order to avoid implying the use of linear light transfer characteristics that is often associated with the term *luminance*. The symbol *L* is sometimes used instead of the symbol *Y* to avoid confusion with the symbol *y* as used for vertical location.
- 3.37 network abstraction layer (NAL) unit:** A *syntax structure* containing an indication of the type of data that follows and *bytes* containing that data in a manner that enables the extraction of a string of data bits from the *syntax structure*.
- 3.38 network abstraction layer (NAL) unit stream:** A sequence of *NAL units*.
- 3.39 non-VCL NAL unit:** A *NAL unit* that is not a *VCL NAL unit*.
- 3.40 omnidirectional video:** A video content in a format that enables rendering according to the user's viewing orientation, e.g., if viewed using a head-mounted device, or according to a user's desired *viewport*, reflecting a potentially rotated viewing position.
- 3.41 output order:** The order in which the *decoded pictures* are output from the *decoder* (for the *decoded pictures* that are to be output from the *decoder*).
- 3.42 output time:** A time when a *decoded picture* is to be output from the *decoder* (for the *decoded pictures* that are to be output from the *decoder*).
- 3.43 packed region:** A region in a *region-wise packed picture* that is mapped to a *projected region* according to a *region-wise packing*.
- 3.44 picture:** An array of *luma* samples in monochrome format or an array of *luma* samples and two corresponding arrays of *chroma* samples in 4:2:0, 4:2:2, and 4:4:4 colour format.  
NOTE – A *picture* could be either a frame or a field. However, in one CLVS, either all *pictures* are frames, or all *pictures* are fields.
- 3.45 picture parameter set (PPS):** A *syntax structure* containing *syntax elements* that apply to zero or more entire *coded pictures* as determined by a *syntax element* that is the same for all *slices* of a *picture* and found in the *picture header* or *slice headers* of each *picture*.
- 3.46 picture unit (PU):** A set of *NAL units* that contain all *VCL NAL units* of a *coded picture* and their associated non-VCL *NAL units*.
- 3.47 projected picture:** A *picture* that uses a *projection* format for *omnidirectional video*.
- 3.48 projected region:** A region in a *projected picture* that is mapped to a *packed region* according to a *region-wise packing*.

- 3.49 projection:** A specified correspondence between the colour samples of a *projected picture* and azimuth and elevation positions on a sphere.
- 3.50 random access:** The act of starting the decoding process for a *coded video bitstream* at a point other than the beginning of the bitstream.
- 3.51 random access skipped leading (RASL) picture:** A *leading picture* that cannot be correctly decoded when the decoding process starts from the *associated IRAP picture*.
- 3.52 reference picture:** A *picture* that contains samples that could be used for *inter prediction* in the decoding process of subsequent pictures in decoding order.
- 3.53 reference picture list:** A list of *reference pictures* that is used for *inter prediction* of a *slice*.
- 3.54 region-wise packed picture:** A decoded picture that contains one or more *packed regions*.  
NOTE – A region-wise packed picture could contain a *region-wise packing* of a *projected picture*.
- 3.55 region-wise packing:** A transformation, resizing, and relocation of *packed regions* of a *region-wise packed picture* to remap the *packed regions* to *projected regions* of a *projected picture*.
- 3.56 sample aspect ratio (SAR):** The indicated width-to-height aspect ratio of the luma samples of the associated *decoded pictures*.
- 3.57 slice:** A region of a *picture* that can be decoded separately from other regions of the same *coded picture* (although in some cases the *decoding process* for the *picture* might use *inter prediction* that makes reference to other previously decoded *reference pictures*).
- 3.58 source:** A term used to describe the video material or some of its attributes before encoding.
- 3.59 sphere coordinates:** The azimuth and elevation angles identifying a location of a point on a sphere.
- 3.60 sphere region:** A region on a sphere, specified either by four *great circles* or by two *azimuth circles* and two *elevation circles*, or such a region on a rotated sphere after applying yaw, pitch, and roll rotations.
- 3.61 step-wise temporal sublayer access (STSA) picture:** A *coded picture* that enables up-switching, at the *coded picture*, to the *temporal sublayer* containing the *coded picture*, from the immediately lower *temporal sublayer* of the same *layer* when the *coded picture* does not belong to the lowest *temporal sublayer*.  
NOTE – An STSA picture does not use pictures in the same layer and with the same temporal sublayer identifier as the STSA picture for inter prediction reference. Pictures following an STSA picture in decoding order in the same layer and with the same temporal sublayer identifier as the STSA picture do not use pictures prior to the STSA picture in decoding order in the same layer and with the same temporal sublayer identifier as the STSA picture for inter prediction reference. STSA pictures in an independent layer (i.e., a layer that does not depend on other layers in its decoding) always have a temporal sublayer identifier greater than 0.
- 3.62 supplemental enhancement information (SEI) message:** A *syntax structure* that provides a particular type of information that assists in processes related to decoding, display or other purposes but is not needed by the *decoding process* in order to determine the values of the samples in *decoded pictures*.
- 3.63 syntax element:** An element of data represented in a *syntax structure*.
- 3.64 syntax structure:** Zero or more *syntax elements* that are present together in a specified order in a string of data bits, where the left-most bit is considered to be the first and most significant bit, and the right-most bit is considered to be the last and least significant bit.
- 3.65 temporal sublayer:** A subset of a temporal scalable *bitstream*, consisting of *VCL NAL units* with a particular value of *temporal sublayer identifier* and the associated *non-VCL NAL units*.
- 3.66 temporal sublayer identifier:** A number greater than or equal to 0 defined by a variable for which the value is specified by a video coding specification such that pictures of all *temporal sublayers* have a specified temporal output order relative to each other and pictures with a lower temporal sublayer identifier can be decoded without reference to pictures with a higher temporal sublayer identifier.
- 3.67 tilt angle:** The angle indicating the amount of tilt of a *sphere region*, measured as the amount of rotation of a *sphere region* along the axis originating from the sphere origin passing through the centre point of the *sphere region*, where the angle value increases clockwise when looking from the origin towards the positive end of the axis.
- 3.68 trailing picture:** A *coded picture* that follows an *IRAP picture* in both decoding order and output order.
- 3.69 video coding layer (VCL) NAL unit:** A collective term for *coded slice NAL units* and the subset of other *NAL units* that have *reserved* values of *NAL unit* type identifiers that are classified as VCL NAL units in a referencing specification.

- 3.70 video usability information (VUI) parameters:** A syntax structure that identifies properties of interpretation of decoded pictures for display purposes, particularly including colour representation information.
- 3.71 viewport:** A region of *omnidirectional video* content suitable for display and viewing by the user.

## 4 Abbreviations

For the purposes of this Recommendation | International Standard, the following abbreviations apply:

APS	Adaptation Parameter Set
AU	Access Unit
CLVS	Coded Layer Video Sequence
CLVSS	Coded Layer Video Sequence Start
CRC	Cyclic Redundancy Check
CVS	Coded Video Sequence
DRAP	Dependent Random Access Point
FIR	Finite Impulse Response
IRAP	Intra Random Access Point
NAL	Network Abstraction Layer
PPS	Picture Parameter Set
PU	Picture Unit
RASL	Random Access Skipped Leading
RWP	Region-Wise Packing
SAR	Sample Aspect Ratio
SARI	Sample Aspect Ratio Information
SEI	Supplemental Enhancement Information
STSA	Step-wise Temporal Sublayer Access
VCL	Video Coding Layer
VUI	Video Usability Information

## 5 Conventions

### 5.1 General

The term "this Specification" is used to refer to this Recommendation | International Standard.

The word "shall" is used to express mandatory requirements for conformance to this Specification. When used to express a mandatory constraint on the values of syntax elements or the values of variables derived from these syntax elements, it is the responsibility of the encoder to ensure that the constraint is fulfilled.

The word "may" is used to refer to behaviour that is allowed, but not necessarily required.

The word "should" is used to refer to behaviour of an implementation that is encouraged to be followed under anticipated ordinary circumstances, but is not a mandatory requirement for conformance to this Specification.

Content of this Specification that is identified as "informative" does not establish any mandatory requirements for conformance to this Specification and is thus not considered an integral part of this Specification. Informative remarks in the text are, in some cases, set apart and prefixed with the word "note" or "NOTE".

The word "reserved" is used to specify that some values of a particular syntax element are for future use by ITU-T | ISO/IEC and shall not be used in syntax structures conforming to this version of this Specification, but could potentially be used in syntax structures conforming to future versions of this Specification by ITU-T | ISO/IEC.

The word "unspecified" is used to describe some values of a particular syntax element to indicate that the values have no specified meaning in this Specification and are not expected to have a specified meaning in the future as an integral part of future versions of this Specification.

The mathematical operators used in this Specification are similar to those used in the C programming language. However, the results of integer division and arithmetic shift operations are defined more precisely, and additional operations are defined, such as exponentiation and real-valued division.

Numbering and counting conventions generally begin from 0, e.g., "the first" is equivalent to the 0-th, "the second" is equivalent to the 1-th, etc.

## 5.2 Arithmetic operators

+	addition
-	subtraction (as a two-argument operator) or negation (as a unary prefix operator)
*	multiplication, including matrix multiplication
	exponentiation
$x^y$	Specifies $x$ to the power of $y$ . In other contexts, such notation is used for superscripting not intended for interpretation as exponentiation.
/	integer division with truncation of the result toward zero For example, $7 / 4$ and $-7 / -4$ are truncated to 1 and $-7 / 4$ and $7 / -4$ are truncated to -1.
÷	division in mathematical equations where no truncation or rounding is intended
$\frac{x}{y}$	division in mathematical equations where no truncation or rounding is intended
$\sum_{i=x}^y f(i)$	summation of $f(i)$ with $i$ taking all integer values from $x$ up to and including $y$
	modulus
$x \% y$	Remainder of $x$ divided by $y$ , defined only for integers $x$ and $y$ with $x \geq 0$ and $y > 0$

## 5.3 Logical operators

$x \ \&\& \ y$	Boolean logical "and" of $x$ and $y$
$x \    \ y$	Boolean logical "or" of $x$ and $y$
!	Boolean logical "not"
$x \ ? \ y \ : \ z$	if $x$ is TRUE or not equal to 0, evaluates to the value of $y$ ; otherwise, evaluates to the value of $z$ .

## 5.4 Relational operators

>	greater than
>=	greater than or equal to
<	less than
<=	less than or equal to
==	equal to
!=	not equal to

When a relational operator is applied to a syntax element or variable that has been assigned the value "na" (not applicable), the value "na" is treated as a distinct value for the syntax element or variable. The value "na" is considered not to be equal to any other value.

## 5.5 Bit-wise operators

&	bit-wise "and" When operating on integer arguments, operates on a two's complement representation of the integer value. When operating on a binary argument that contains fewer bits than another argument, the shorter argument is extended by adding more significant bits equal to 0.
	bit-wise "or"

When operating on integer arguments, operates on a two's complement representation of the integer value. When operating on a binary argument that contains fewer bits than another argument, the shorter argument is extended by adding more significant bits equal to 0.

$\wedge$  bit-wise "exclusive or"

When operating on integer arguments, operates on a two's complement representation of the integer value. When operating on a binary argument that contains fewer bits than another argument, the shorter argument is extended by adding more significant bits equal to 0.

$x \gg y$  arithmetic right shift of a two's complement integer representation of  $x$  by  $y$  binary digits

This function is defined only for non-negative integer values of  $y$ . Bits shifted into the most significant bits (MSBs) as a result of the right shift have a value equal to the MSB of  $x$  prior to the shift operation.

$x \ll y$  arithmetic left shift of a two's complement integer representation of  $x$  by  $y$  binary digits

This function is defined only for non-negative integer values of  $y$ . Bits shifted into the least significant bits (LSBs) as a result of the left shift have a value equal to 0.

## 5.6 Assignment operators

$=$  assignment operator

$++$  increment, i.e.,  $x++$  is equivalent to  $x = x + 1$ ; when used in an array index, evaluates to the value of the variable prior to the increment operation

$--$  decrement, i.e.,  $x--$  is equivalent to  $x = x - 1$ ; when used in an array index, evaluates to the value of the variable prior to the decrement operation

$+=$  increment by amount specified, i.e.,  $x += 3$  is equivalent to  $x = x + 3$ , and  $x += (-3)$  is equivalent to  $x = x + (-3)$

$-=$  decrement by amount specified, i.e.,  $x -= 3$  is equivalent to  $x = x - 3$ , and  $x -= (-3)$  is equivalent to  $x = x - (-3)$ .

## 5.7 Range notation

$x = y..z$   $x$  takes on integer values starting from  $y$  to  $z$ , inclusive, with  $x$ ,  $y$ , and  $z$  being integer numbers and  $z$  being greater than  $y$ .

## 5.8 Mathematical functions

$$\text{Abs}(x) = \begin{cases} x & ; \quad x \geq 0 \\ -x & ; \quad x < 0 \end{cases} \quad (1)$$

$\text{Asin}(x)$  trigonometric inverse sine function, operating on an argument  $x$  that is in the range of  $-1.0$  to  $1.0$ , inclusive, with an output value in the range of  $-\pi/2$  to  $\pi/2$ , inclusive, in units of radians (2)

$\text{Atan}(x)$  trigonometric inverse tangent function, operating on an argument  $x$ , with an output value in the range of  $-\pi/2$  to  $\pi/2$ , inclusive, in units of radians (3)

$$\text{Atan2}(y, x) = \begin{cases} \text{Atan}\left(\frac{y}{x}\right) & ; \quad x > 0 \\ \text{Atan}\left(\frac{y}{x}\right) + \pi & ; \quad x < 0 \ \&\& \ y \geq 0 \\ \text{Atan}\left(\frac{y}{x}\right) - \pi & ; \quad x < 0 \ \&\& \ y < 0 \\ +\frac{\pi}{2} & ; \quad x = 0 \ \&\& \ y \geq 0 \\ -\frac{\pi}{2} & ; \quad \text{otherwise} \end{cases} \quad (4)$$

$\text{Ceil}(x)$  smallest integer greater than or equal to  $x$ . (5)

$$\text{Clip3}(x, y, z) = \begin{cases} x & ; \quad z < x \\ y & ; \quad z > y \\ z & ; \quad \text{otherwise} \end{cases} \quad (6)$$

$\text{Cos}(x)$  trigonometric cosine function operating on an argument  $x$  in units of radians. (7)

$\text{Floor}(x)$  largest integer less than or equal to  $x$ . (8)

$\text{Ln}(x)$  natural logarithm of  $x$  (the base- $e$  logarithm, where  $e$  is the natural logarithm base constant 2.718 281 828...). (9)

$$\text{Max}(x, y) = \begin{cases} x & ; \quad x \geq y \\ y & ; \quad x < y \end{cases} \quad (10)$$

$$\text{Round}(x) = \text{Sign}(x) * \text{Floor}(\text{Abs}(x) + 0.5) \quad (11)$$

$$\text{Sign}(x) = \begin{cases} 1 & ; \quad x > 0 \\ 0 & ; \quad x = 0 \\ -1 & ; \quad x < 0 \end{cases} \quad (12)$$

$\text{Sin}(x)$  trigonometric sine function operating on an argument  $x$  in units of radians (13)

$\text{Sqrt}(x)$  square root of  $x$  (14)

$\text{Tan}(x)$  trigonometric tangent function operating on an argument  $x$  in units of radians (15)

## 5.9 Order of operation precedence

When order of precedence in an expression is not indicated explicitly by use of parentheses, the following rules apply:

- Operations of a higher precedence are evaluated before any operation of a lower precedence.
- Operations of the same precedence are evaluated sequentially from left to right.

Table 1 specifies the precedence of operations from highest to lowest; a higher position in the table indicates a higher precedence.

NOTE – For those operators that are also used in the C programming language, the order of precedence used in this Specification is the same as used in the C programming language.

**Table 1 – Operation precedence from highest (at top of table) to lowest (at bottom of table)**

operations (with operands $x, y,$ and $z$ )
"x++", "x--"
"!x", "-x" (as a unary prefix operator)
$x^y$
"x * y", "x / y", "x ÷ y", " $\frac{x}{y}$ ", "x % y"
"x + y", "x - y" (as a two-argument operator), " $\sum f(i)$ "
"x << y", "x >> y"
"x < y", "x <= y", "x > y", "x >= y"
"x == y", "x != y"
"x & y"
"x   y"
"x && y"
"x    y"
"x ? y : z"
"x.y"
"x = y", "x += y", "x -= y"

## 5.10 Variables, syntax elements and tables

Syntax elements in the syntax tables are represented in **bold** type. Each syntax element is described by its name (all lower case letters with underscore characters), and one descriptor for its method of coded representation. The decoding process behaves according to the value of the syntax element and to the values of previously decoded syntax elements. When a value of a syntax element is used in the syntax tables or the text, it appears in regular (i.e., not bold) type.

In some cases, the syntax tables and semantics use the values of other variables derived from the values of syntax elements. Such variables appear in the syntax tables, or text, named by a mixture of lower case and upper case letter and without any underscore characters. Variables starting with an upper case letter are derived for the decoding of the current syntax structure and all depending syntax structures. Variables starting with an upper case letter could, in some cases, be used in the decoding process for later syntax structures without mentioning the originating syntax structure of the variable. Variables starting with a lower case letter are only used within the clause in which they are derived.

In some cases, "mnemonic" names for syntax element values or variable values are used interchangeably with their numerical values. Sometimes "mnemonic" names are used without any associated numerical values. The association of values and names is specified in the text. The names are constructed from one or more groups of letters separated by an underscore character. Each group starts with an upper case letter and could contain more upper case letters.

NOTE – The syntax is described in a manner that closely follows the C-language syntactic constructs.

Functions that specify properties of the current position in the SEI message payload data are referred to as syntax functions. These functions are specified in clause 6.3 and assume the existence of a pointer with an indication of the position of the next bit to be read by the decoding process from the payload data. Syntax functions are described by their names, which are constructed as syntax element names and end with left and right round parentheses including zero or more variable names (for definition) or values (for usage), separated by commas (if more than one variable).

Functions that are not syntax functions (including mathematical functions specified in clause 5.8) are described by their names, which start with an upper case letter, contain a mixture of lower and upper case letters without any underscore character, and end with left and right parentheses including zero or more variable names (for definition) or values (for usage) separated by commas (if more than one variable).

A one-dimensional array is referred to as a list. A two-dimensional array is referred to as a matrix. Arrays can either be syntax elements or variables. Subscripts or square parentheses are used for the indexing of arrays. In reference to a visual depiction of a matrix, the first subscript is used as a row (vertical) index and the second subscript is used as a column (horizontal) index. The indexing order is reversed when using square parentheses rather than subscripts for indexing. Thus, an element of a matrix  $s$  at horizontal position  $x$  and vertical position  $y$  could be denoted either as  $s[x][y]$  or as  $s_{yx}$ . A single column of a matrix could be referred to as a list and denoted by omission of the row index. Thus, the column of a matrix  $s$  at horizontal position  $x$  could be referred to as the list  $s[x]$ .

A specification of values of the entries in rows and columns of an array could be denoted by  $\{ \{ \dots \} \{ \dots \} \}$ , where each inner pair of brackets specifies the values of the elements within a row in increasing column order and the rows are ordered in increasing row order. Thus, setting a matrix  $s$  equal to  $\{ \{ 1 \ 6 \} \{ 4 \ 9 \} \}$  specifies that  $s[0][0]$  is set equal to 1,  $s[1][0]$  is set equal to 6,  $s[0][1]$  is set equal to 4, and  $s[1][1]$  is set equal to 9.

Binary notation is indicated by enclosing the string of bit values by single quote marks. For example, '01000001' represents an eight-bit string having only its second and its last bits (counted from the most to the least significant bit) equal to 1.

Hexadecimal notation, indicated by prefixing the hexadecimal number by "0x", is used in some cases instead of binary notation when the number of bits is an integer multiple of 4. For example, 0x41 represents an eight-bit string having only its second and its last bits (counted from the most to the least significant bit) equal to 1.

Numerical values not enclosed in single quotes and not prefixed by "0x" are decimal values.

A value equal to 0 represents a FALSE condition in a test statement. The value TRUE is represented by any value different from zero.

## 5.11 Text description of logical operations

In the text, a statement of logical operations as would be described mathematically in the following form:

```
if( condition 0 )
    statement 0
else if( condition 1 )
    statement 1
...
else /* informative remark on remaining condition */
    statement n
```

is typically described in the following manner:

... as follows / ... the following applies:

- If condition 0, statement 0
- Otherwise, if condition 1, statement 1
- ...
- Otherwise (informative remark on remaining condition), statement n

Each "If ... Otherwise, if ... Otherwise, ..." statement in the text is introduced with "... as follows" or "... the following applies" immediately followed by "If ... ". The last condition of the "If ... Otherwise, if ... Otherwise, ..." is always an "Otherwise, ...". Interleaved "If ... Otherwise, if ... Otherwise, ..." statements can be identified by matching "... as follows" or "... the following applies" with the ending "Otherwise, ...".

In the text, a statement of logical operations as would be described mathematically in the following form:

```
if( condition 0a  &&  condition 0b )
    statement 0
else if( condition 1a  ||  condition 1b )
    statement 1
...
else
    statement n
```

is typically described in the following manner:

... as follows / ... the following applies:

- If all of the following conditions are true, statement 0:
  - condition 0a
  - condition 0b
- Otherwise, if one or more of the following conditions are true, statement 1:
  - condition 1a
  - condition 1b
- ...
- Otherwise, statement n

In the text, a statement of logical operations as would be described mathematically in the following form:

```
if( condition 0 )
    statement 0
if( condition 1 )
    statement 1
```

is typically described in the following manner:

```
When condition 0, statement 0
When condition 1, statement 1
```

## 5.12 Processes

Processes are used to describe the decoding of syntax elements. A process has a separate specification and invoking. All syntax elements and upper case variables that pertain to the current syntax structure and depending syntax structures are available in the process specification and invoking. A process specification might also have a lower case variable explicitly specified as input. Each process specification has explicitly specified an output. The output is a variable that can either be an upper case variable or a lower case variable.

When invoking a process, the assignment of variables is specified as follows:

- If the variables at the invoking and the process specification do not have the same name, the variables are explicitly assigned to lower case input or output variables of the process specification.
- Otherwise (the variables at the invoking and the process specification have the same name), assignment is implied.

## 6 Syntax and semantics

### 6.1 General

This Specification is written in a manner such that it is intended to be referenced by other technical specifications. Such other technical specifications are to be written in a manner to specify certain necessary elements to enable the use of the specified VUI parameters and SEI messages.

Technical specifications that reference this Specification for carrying VUI parameters syntax structure shall specify a container to carry the data of the VUI parameters syntax structure and to identify the length in bits of the VUI parameters syntax structure, e.g., the `vui_payload()` syntax structure specified in Rec. ITU-T H.266 | ISO/IEC 23090-3. The design of the container needs to provide the ability to detect the number of bits in the `vui_parameters()` syntax structure and to allow the number of bits to be increased in future versions of this Specification, thus enabling this Specification to provide extensibility by directly appending additional syntax elements to the end of the `vui_parameters()` syntax structure in future versions of this Specification. The syntax of the container of the `vui_parameters()` syntax structure is outside the scope of this Specification.

Technical specifications that reference this Specification for carrying SEI messages shall specify a way to carry the payload syntax of each specified SEI message, to identify which SEI message is conveyed, and to identify the length in bits of the SEI message syntax structure, the `sei_payload()` syntax structure specified in Rec. ITU-T H.266 | ISO/IEC 23090-3 and Rec. ITU-T H.265 | ISO/IEC 23008-2. The design of the container needs to provide the ability to detect the number of bits in an SEI message and to allow the number of bits to be increased in future versions of this Specification, thus enabling this Specification to provide extensibility by directly appending additional syntax elements to the end of the SEI message syntax structure in future versions of this Specification. The syntax of the container of the SEI messages as well as the method of identifying which SEI message is outside the scope of this Specification.

The length of the VUI parameters syntax structure or an SEI message syntax structure in bits is referred to herein by the variable `PayloadBits`, which is provided by an external means not specified in this Specification. The number of bytes that contains the payload data is referred to herein by the variable `payloadSize`, where `payloadSize` is equal to  $\text{Ceil}(\text{PayloadBits} \div 8)$ .

For the VUI parameters and most of the SEI messages specified in this version of this Specification (other than the filler payload, user data registered, user data unregistered, and reserved SEI messages), the values of `PayloadBits` and `payloadSize` are not used for the parsing of the syntax. However, in some future version of this Specification, the value of `PayloadBits` or `payloadSize` could be used as part of the syntax specification for these syntax structures, for example to identify whether payload extension data is present in the VUI parameters or in an SEI message syntax structure that was not specified in an earlier version of this Specification.

The syntax specification in Rec. ITU-T H.266 | ISO/IEC 23090-3 and Rec. ITU-T H.265 | ISO/IEC 23008-2 establishes, under some circumstances, a certain pattern of bits that is used for detecting the value of `PayloadBits`. It is expected that future versions of this Specification will be written to ensure that such future versions will be compatible with the pattern for extension data that is specified in those other specifications. This pattern is such that when extension data is present and the last bit of such extension data is the last (least significant) bit of a byte, the extension data ends with a byte that contains a bit equal to 1 followed by 7 bits that are equal to 0.

It is a requirement of bitstream conformance to this version of this Specification that the value of `PayloadBits`, as determined by this external means, shall be equal to the number of bits in the VUI parameters syntax structure or the SEI message syntax structure, as applicable.

It is a requirement of decoder conformance to this version of this Specification that when `PayloadBits` is greater than the number of bits in the VUI parameters syntax structure or an SEI message syntax structure, the extra data at the end of the VUI or SEI payload data shall be ignored. The semantics for such extra data could potentially be specified in some future version of this Specification.

For example, each SEI message could be carried as a string of data bits that is prefixed with an SEI message payload type indication derived as a `payloadType` variable within a NAL unit that could contain emulation prevention bytes as specified in Rec. ITU-T H.266 | ISO/IEC 23090-3. When such emulation prevention bytes are present, the emulation prevention bytes are not counted when determining the values of `PayloadBits` and `payloadSize`.

### 6.2 Method of specifying syntax in tabular form

The syntax tables in this Specification specify a superset of the syntax of the VUI parameters and all allowed SEI messages. Additional constraints on the syntax are specified, either directly or indirectly, in other clauses.

The following table lists examples of the syntax specification format. When **`syntax_element`** appears, it specifies that a syntax element is parsed from the VUI parameters syntax or an SEI message syntax and the data pointer is advanced to the next position beyond the syntax element in the syntax parsing process.

	Descriptor
/* A statement can be a syntax element with an associated descriptor or can be an expression used to specify conditions for the existence, type and quantity of syntax elements, as in the following two examples */	
<b>syntax_element</b>	ue(v)
conditioning statement	
/* A group of statements enclosed in curly brackets is a compound statement and is treated functionally as a single statement. */	
{	
statement	
statement	
...	
}	
/* A "while" structure specifies a test of whether a condition is true, and if true, specifies evaluation of a statement (or compound statement) repeatedly until the condition is no longer true */	
while( condition )	
statement	
/* A "do ... while" structure specifies evaluation of a statement once, followed by a test of whether a condition is true, and if true, specifies repeated evaluation of the statement until the condition is no longer true */	
do	
statement	
while( condition )	
/* An "if ... else" structure specifies a test of whether a condition is true and, if the condition is true, specifies evaluation of a primary statement, otherwise, specifies evaluation of an alternative statement. The "else" part of the structure and the associated alternative statement is omitted if no alternative statement evaluation is needed */	
if( condition )	
primary statement	
else	
alternative statement	
/* A "for" structure specifies evaluation of an initial statement, followed by a test of a condition, and if the condition is true, specifies repeated evaluation of a primary statement followed by a subsequent statement until the condition is no longer true. */	
for( initial statement; condition; subsequent statement )	
primary statement	

### 6.3 Specification of syntax functions and descriptors

The functions presented in this clause are used in the syntactical description. These functions are expressed in terms of the value of the VUI parameters `syntax` or an SEI message `syntax` data pointer that indicates the position of the next bit to be read by the decoding process from the syntax structure.

`read_bits( n )` reads the next `n` bits from the syntax structure and advances the data pointer by `n` bit positions. When `n` is equal to 0, `read_bits( n )` is specified to return a value equal to 0 and to not advance the data pointer.

The following descriptors specify the parsing process of each syntax element:

- `b(8)`: byte having any pattern of bit string (8 bits). The parsing process for this descriptor is specified by the return value of the function `read_bits( 8 )`.

- f(n): fixed-pattern bit string using n bits written (from left to right) with the left bit first. The parsing process for this descriptor is specified by the return value of the function read\_bits( n ).
- i(n): signed integer using n bits. When n is "v" in the syntax table, the number of bits varies in a manner dependent on the value of other syntax elements. The parsing process for this descriptor is specified by the return value of the function read\_bits( n ) interpreted as a two's complement integer representation with most significant bit written first.
- se(v): signed integer 0-th order Exp-Golomb-coded syntax element with the left bit first. The parsing process for this descriptor is specified in clause 9 with the order k equal to 0.
- u(n): unsigned integer using n bits. When n is "v" in the syntax table, the number of bits varies in a manner dependent on the value of other syntax elements. The parsing process for this descriptor is specified by the return value of the function read\_bits( n ) interpreted as a binary representation of an unsigned integer with most significant bit written first.
- ue(v): unsigned integer 0-th order Exp-Golomb-coded syntax element with the left bit first. The parsing process for this descriptor is specified in clause 9 with the order k equal to 0.

## 7 Video usability information parameters

### 7.1 General

Clause 7 specifies the syntax and semantics for VUI parameters.

When any information regarding the interpretation of the pictures is not present in the vui\_parameters( ) syntax structure, or the vui\_parameters( ) syntax structure is not present, there may be some external means that controls the interpretation.

### 7.2 VUI parameters syntax

vui_parameters( payloadSize ) {	Descriptor
<b>vui_progressive_source_flag</b>	u(1)

### 7.3 VUI parameters semantics

VUI parameters apply to one or more CLVSs.

Use of the VUI parameters requires the definition of the following variables:

- A chroma format indicator, denoted herein by **ChromaFormatIdc**, such that the value 0 indicates that the picture has only a luma component and other values indicate that the picture has three colour components that consist of a luma component and two associated chroma components, such that the width and height of each chroma component are the width and height of the luma component divided by **SubWidthC** and **SubHeightC**, respectively, where **SubWidthC** and **SubHeightC** are determined from **ChromaFormatIdc** as specified by Table 2.
- A bit depth for the samples of the luma component, denoted herein by **BitDepth<sub>Y</sub>**, and when **ChromaFormatIdc** is not equal to 0, a bit depth for the samples of the two associated chroma components, denoted herein by **BitDepth<sub>C</sub>**.

**Table 2 – SubWidthC and SubHeightC values derived from ChromaFormatIdc**

<b>ChromaFormatIdc</b>	<b>Chroma format</b>	<b>SubWidthC</b>	<b>SubHeightC</b>
0	Monochrome	1	1
1	4:2:0	2	2
2	4:2:2	2	1
3	4:4:4	1	1

**vui\_progressive\_source\_flag** and **vui\_interlaced\_source\_flag** are interpreted as follows:

- If **vui\_progressive\_source\_flag** is equal to 1 and **vui\_interlaced\_source\_flag** is equal to 0, the source scan type of the pictures should be interpreted as progressive only.
- Otherwise, if **vui\_progressive\_source\_flag** is equal to 0 and **vui\_interlaced\_source\_flag** is equal to 1, the source scan type of the pictures should be interpreted as interlaced only.
- Otherwise, if **vui\_progressive\_source\_flag** is equal to 0 and **vui\_interlaced\_source\_flag** is equal to 0, the source scan type of the pictures should be interpreted as unknown or unspecified or specified by external means not specified in this Specification.
- Otherwise (**vui\_progressive\_source\_flag** is equal to 1 and **vui\_interlaced\_source\_flag** is equal to 1), the source scan type of each picture is indicated at the picture level using the syntax element **ffi\_source\_scan\_type** in a frame-field information SEI message.

**vui\_non\_packed\_constraint\_flag** equal to 1 specifies that there shall not be any frame packing arrangement SEI messages present in the bitstream that apply to the CLVS. **vui\_non\_packed\_constraint\_flag** equal to 0 does not impose such a constraint.

**vui\_non\_projected\_constraint\_flag** equal to 1 specifies that there shall not be any equirectangular projection SEI messages or generalized cubemap projection SEI messages present in the bitstream that apply to the CLVS. **vui\_non\_projected\_constraint\_flag** equal to 0 does not impose such a constraint.

**vui\_aspect\_ratio\_info\_present\_flag** equal to 1 specifies that **vui\_aspect\_ratio\_idc** is present. **vui\_aspect\_ratio\_info\_present\_flag** equal to 0 specifies that **vui\_aspect\_ratio\_idc** is not present.

**vui\_aspect\_ratio\_constant\_flag** equal to 1 specifies that the values of **vui\_aspect\_ratio\_idc**, **SarWidth**, and **SarHeight** apply to all pictures in the CLVS and there is no SARI SEI message present in the CLVS. **vui\_aspect\_ratio\_constant\_flag** equal to 0 specifies that the values of **vui\_aspect\_ratio\_idc**, **SarWidth**, and **SarHeight** might or might not apply to all pictures in the CLVS and that SARI SEI messages could be present in the CLVS indicating a different sample aspect ratio

applicable to the pictures associated with SARI SEI messages. When the `vui_aspect_ratio_constant_flag` syntax element is not present, the value of `vui_aspect_ratio_constant_flag` is inferred to be equal to 0.

**`vui_aspect_ratio_idc`**, when not equal to 255, indicates the SAR of the luma samples of decoded pictures in the CLVS, unless indicated otherwise by associated SARI SEI messages when `vui_aspect_ratio_constant_flag` is equal to 0. Its semantics are as specified for the `SampleAspectRatio` parameter in Rec. ITU-T H.273 | ISO/IEC 23091-2. When the `vui_aspect_ratio_idc` syntax element is not present, the value of `vui_aspect_ratio_idc` is inferred to be equal to 0. Values of `vui_aspect_ratio_idc` that are specified as reserved for future use in Rec. ITU-T H.273 | ISO/IEC 23091-2 shall not be present in bitstreams conforming to this version of this Specification. Decoders shall interpret values of `vui_aspect_ratio_idc` that are reserved for future use in Rec. ITU-T H.273 | ISO/IEC 23091-2 as equivalent to the value 0.

**`vui_sar_width`**, when present, indicates the horizontal size of the SAR (in arbitrary units) of the luma samples of decoded pictures in the CLVS, unless indicated otherwise by associated SARI SEI messages when `vui_aspect_ratio_constant_flag` is equal to 0.

**`vui_sar_height`**, when present, indicates the vertical size of the SAR (in the same arbitrary units as `vui_sar_width`) of the luma samples of decoded pictures in the CLVS, unless indicated otherwise by associated SARI SEI messages when `vui_aspect_ratio_constant_flag` is equal to 0.

When present, `vui_sar_width` and `vui_sar_height` shall be relatively prime or equal to 0. When `vui_aspect_ratio_idc` is equal to 0 or `vui_sar_width` is equal to 0 or `vui_sar_height` is equal to 0, the SAR is unknown or unspecified in this Specification or may be determined by other means, such as the SARI SEI message.

**`vui_overscan_info_present_flag`** equal to 1 specifies that the `vui_overscan_appropriate_flag` is present. When `vui_overscan_info_present_flag` is equal to 0 or is not present, the preferred display method for the video signal is unknown or unspecified or specified by external means.

**`vui_overscan_appropriate_flag`** equal to 1 indicates that the cropped decoded pictures output are suitable for display using overscan. `vui_overscan_appropriate_flag` equal to 0 indicates that the cropped decoded pictures output contain visually important information in the entire region out to the edges of the conformance cropping window of the picture, such that the cropped decoded pictures output should not be displayed using overscan. Instead, they should be displayed using either an exact match between the display area and the conformance cropping window, or using underscan. As used in this paragraph, the term "overscan" refers to display processes in which some parts near the borders of the cropped decoded pictures are not visible in the display area. The term "underscan" describes display processes in which the entire cropped decoded pictures are visible in the display area, but they do not cover the entire display area. For display processes that neither use overscan nor underscan, the display area exactly matches the area of the cropped decoded pictures.

NOTE 1 – For example, `vui_overscan_appropriate_flag` equal to 1 might be used for entertainment television programming or for a live view of people in a videoconference, and `vui_overscan_appropriate_flag` equal to 0 might be used for computer screen capture or security camera content.

**`vui_colour_description_present_flag`** equal to 1 specifies that `vui_colour primaries`, `vui_transfer_characteristics`, and `vui_matrix_coeffs` are present. `vui_colour_description_present_flag` equal to 0 specifies that `vui_colour primaries`, `vui_transfer_characteristics`, and `vui_matrix_coeffs` are not present.

**`vui_colour primaries`** indicates the chromaticity coordinates of the source colour primaries. Its semantics are as specified for the `ColourPrimaries` parameter in Rec. ITU-T H.273 | ISO/IEC 23091-2. When the `vui_colour primaries` syntax element is not present, the value of `vui_colour primaries` is inferred to be equal to 2 (the chromaticity is unknown or unspecified or determined by other means not specified in this Specification). Values of `vui_colour primaries` that are identified as reserved for future use in Rec. ITU-T H.273 | ISO/IEC 23091-2 shall not be present in bitstreams conforming to this version of this Specification. Decoders shall interpret reserved values of `vui_colour primaries` as equivalent to the value 2.

**`vui_transfer_characteristics`** indicates the transfer characteristics function of the colour representation. Its semantics are as specified for the `TransferCharacteristics` parameter in Rec. ITU-T H.273 | ISO/IEC 23091-2. When the `vui_transfer_characteristics` syntax element is not present, the value of `vui_transfer_characteristics` is inferred to be equal to 2 (the transfer characteristics are unknown or unspecified or determined by other means not specified in this Specification). Values of `vui_transfer_characteristics` that are identified as reserved for future use in Rec. ITU-T H.273 | ISO/IEC 23091-2 shall not be present in bitstreams conforming to this version of this Specification. Decoders shall interpret reserved values of `vui_transfer_characteristics` as equivalent to the value 2.

**`vui_matrix_coeffs`** describes the equations used in deriving luma and chroma signals from the green, blue, and red, or Y, Z, and X primaries. Its semantics are as specified for `MatrixCoefficients` in Rec. ITU-T H.273 | ISO/IEC 23091-2.

`vui_matrix_coeffs` shall not be equal to 0 unless both of the following conditions are true:

- `BitDepthC` is equal to `BitDepthY`.
- `ChromaFormatIdc` is equal to 3 (the 4:4:4 chroma format).

The specification of the use of `vui_matrix_coeffs` equal to 0 under all other conditions is reserved for future use by ITU-T | ISO/IEC.

`vui_matrix_coeffs` shall not be equal to 8 unless one of the following conditions is true:

- `BitDepthC` is equal to `BitDepthY`,
- `BitDepthC` is equal to `BitDepthY + 1` and `ChromaFormatIdc` is equal to 3 (the 4:4:4 chroma format).

The specification of the use of `vui_matrix_coeffs` equal to 8 under all other conditions is reserved for future use by ITU-T | ISO/IEC.

When the `vui_matrix_coeffs` syntax element is not present, the value of `vui_matrix_coeffs` is inferred to be equal to 2 (unknown or unspecified or determined by other means not specified in this Specification).

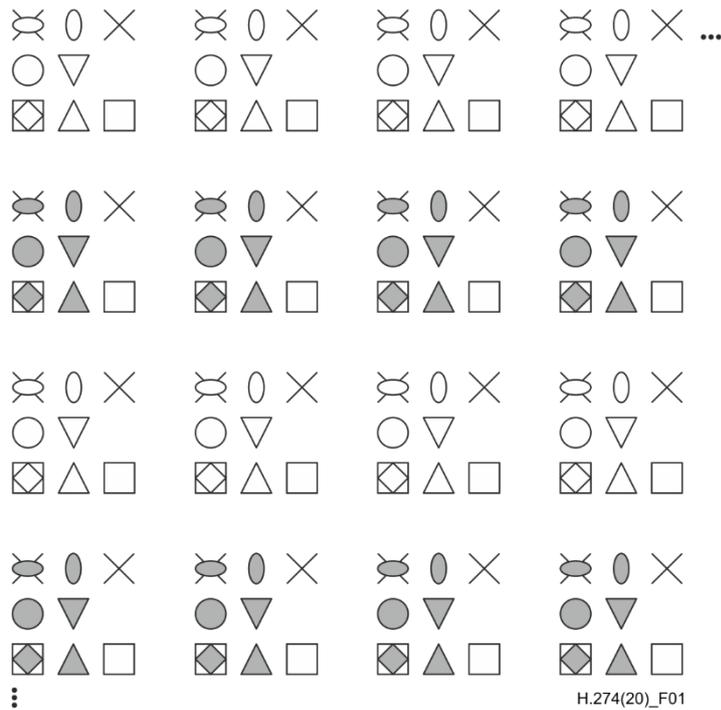

**`vui_full_range_flag`** indicates the scaling and offset values applied in association with the matrix coefficients. Its semantics are as specified for the `VideoFullRangeFlag` parameter in Rec. ITU-T H.273 | ISO/IEC 23091-2. When not present, the value of `vui_full_range_flag` is inferred to be equal to 0.

**`vui_chroma_loc_info_present_flag`** equal to 1 specifies that either `vui_chroma_sample_loc_type_frame` or both `vui_chroma_sample_loc_type_top_field` and `vui_chroma_sample_loc_type_bottom_field` are present. `vui_chroma_loc_info_present_flag` equal to 0 specifies that `vui_chroma_sample_loc_type_frame`, `vui_chroma_sample_loc_type_top_field`, and `vui_chroma_sample_loc_type_bottom_field` are not present.

When `ChromaFormatIdc` is not equal to 1, `vui_chroma_loc_info_present_flag` should be equal to 0.

**`vui_chroma_sample_loc_type_frame`, `vui_chroma_sample_loc_type_top_field`, and `vui_chroma_sample_loc_type_bottom_field`**, when present, specify the location of chroma samples as follows:

- If `GeneralProgressiveSourceFlag` is equal to 1, `GeneralInterlacedSourceFlag` is equal to 0, and `ChromaFormatIdc` is equal to 1 (4:2:0 chroma format), `vui_chroma_sample_loc_type_frame` specifies the location of chroma samples for both fields of each frame of the CLVS as shown in Figure 1.
- Otherwise, if `ChromaFormatIdc` is equal to 1 (4:2:0 chroma format), `vui_chroma_sample_loc_type_top_field` and `vui_chroma_sample_loc_type_bottom_field` specify the location of chroma samples for each top field and bottom field of the CLVS, respectively, as shown in Figure 1.
- Otherwise (`ChromaFormatIdc` is not equal to 1), the values of the syntax elements `chroma_sample_loc_type`, `vui_chroma_sample_loc_type_top_field` and `vui_chroma_sample_loc_type_bottom_field` shall be ignored.

**Interpretation of symbols**

Luma sample position indications:

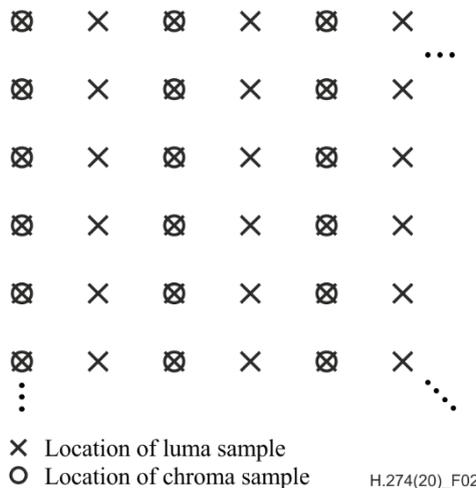

Luma sample top field
  Luma sample bottom field

Chroma sample position indications, where gray fill indicates a bottom field sample type and no fill indicates a top field sample type:

Chroma sample type 2
  Chroma sample type 3  
 Chroma sample type 0
  Chroma sample type 1  
 Chroma sample type 4
  Chroma sample type 5

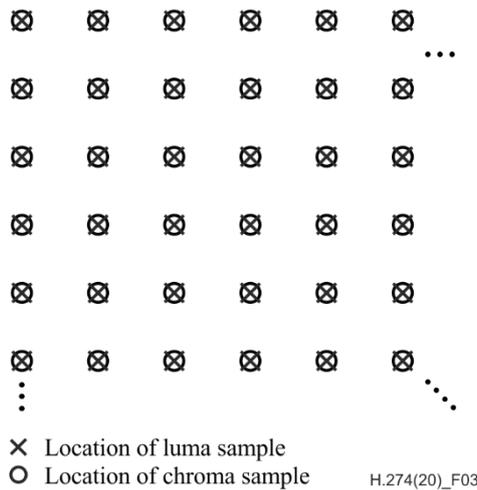

**Figure 1 – Location of chroma samples for top and bottom fields for ChromaFormatIdc equal to 1 (4:2:0 chroma format) as a function of vui\_chroma\_sample\_loc\_type\_top\_field and vui\_chroma\_sample\_loc\_type\_bottom\_field in the range of 0 to 5, inclusive**

When ChromaFormatIdc is equal to 2 (4:2:2 chroma format), the nominal positions of the chroma samples are co-sited with the corresponding luma samples and the nominal locations in a picture are as shown in Figure 2.

**Figure 2 – Nominal vertical and horizontal locations of 4:2:2 luma and chroma samples in a picture**

When ChromaFormatIdc is equal to 3 (4:4:4 chroma format), the nominal positions of the chroma samples are such that all array samples are co-sited for all cases of pictures and the nominal locations in a picture are as shown in Figure 3.

**Figure 3 – Nominal vertical and horizontal locations of 4:4:4 luma and chroma samples in a picture**

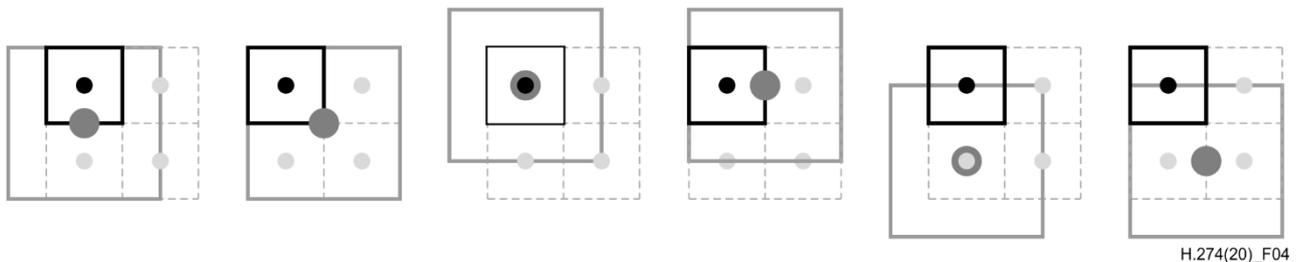

When ChromaFormatIdc is equal to 0, there is no chroma sample array.

When present, the values of `vui_chroma_sample_loc_type_frame`, `vui_chroma_sample_loc_type_top_field` and `vui_chroma_sample_loc_type_bottom_field` shall be in the range of 0 to 6, inclusive.

When ChromaFormatIdc is equal to 1 and `vui_chroma_loc_info_present_flag` is equal to 0, `vui_chroma_sample_loc_type_frame` is not present and is inferred to be equal to 6, which indicates that the location of the chroma samples is unknown or unspecified or specified by other means not specified in this Specification. When `vui_chroma_sample_loc_type_top_field` and `vui_chroma_sample_loc_type_bottom_field` are not present, the values of `vui_chroma_sample_loc_type_top_field` and `vui_chroma_sample_loc_type_bottom_field` are inferred to be equal to `vui_chroma_sample_loc_type_frame`.

NOTE 2 – In Rec. ITU-T H.266 | ISO/IEC 23090-3 and Rec. ITU-T H.265 | ISO/IEC 23008-2, a nominal chroma sampling type is identified for ChromaFormatIdc equal to 1 that corresponds to `vui_chroma_sample_loc_type_frame`, `vui_chroma_sample_loc_type_top_field` and `vui_chroma_sample_loc_type_bottom_field` equal to 0.

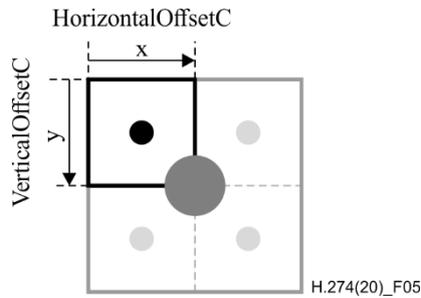

Figure 4 illustrates the indicated relative position of the top-left chroma sample when ChromaFormatIdc is equal to 1 (i.e., the 4:2:0 chroma format), and `vui_chroma_sample_loc_type_top_field` or `vui_chroma_sample_loc_type_bottom_field` is equal to the value of a variable Chroma420LocType. The region represented by the top-left 4:2:0 chroma sample (depicted as a large grey, solid-line square with a large grey dot at its centre) is shown relative to the region represented by the top-left luma sample (depicted as a small black square with a small black dot at its centre). The regions represented by neighbouring luma samples are depicted as small grey, dotted-line squares with small grey dots at their centres.

**Figure 4 – Location of the top-left chroma sample when ChromaFormatIdc is equal to 1 (4:2:0 chroma format) and Chroma420LocType is equal to 0 to 5, inclusive, from left to right**

The relative spatial positioning of the chroma samples, as illustrated in Figure 5, can be expressed by defining two variables HorizontalOffsetC and VerticalOffsetC as a function of ChromaFormatIdc and the variable Chroma420LocType as given by Table 3, where HorizontalOffsetC is the horizontal (x) position of the centre of the top-left chroma sample relative to the centre of the top-left luma sample in units of luma samples and VerticalOffsetC is the vertical (y) position of the centre of the top-left chroma sample relative to the centre of the top-left luma sample in units of luma samples.

In a typical FIR filter design, when ChromaFormatIdc is equal to 1 (4:2:0 chroma format) or 2 (4:2:2 chroma format), HorizontalOffsetC and VerticalOffsetC would serve as the phase offsets for the horizontal and vertical filter operations, respectively, for separable downsampling from 4:4:4 chroma format to the chroma format indicated by ChromaFormatIdc.

**Figure 5 – Location of the top-left chroma sample when ChromaFormatIdc is equal to 1 (4:2:0 chroma format) when Chroma420LocType is equal to 1**

**Table 3 – Definition of HorizontalOffsetC and VerticalOffsetC as a function of ChromaFormatIdc and Chroma420LocType**

ChromaFormatIdc	Chroma420LocType	HorizontalOffsetC	VerticalOffsetC
1 (4:2:0)	0	0	0.5
1 (4:2:0)	1	0.5	0.5
1 (4:2:0)	2	0	0
1 (4:2:0)	3	0.5	0
1 (4:2:0)	4	0	1
1 (4:2:0)	5	0.5	1
2 (4:2:2)	–	0	0
3 (4:4:4)	–	0	0

When ChromaFormatIdc is equal to 1 (4:2:0 chroma format) and the decoded video content is intended for interpretation according to Rec. ITU-R BT.2020 or Rec. ITU-R BT.2100, vui\_chroma\_loc\_info\_present\_flag should be equal to 1, and vui\_chroma\_sample\_loc\_type\_frame, vui\_chroma\_sample\_loc\_type\_top\_field, and vui\_chroma\_sample\_loc\_type\_bottom\_field (as applicable) should be equal to 2.

## 8 SEI messages

### 8.1 General

Clause 8 specifies the syntax and semantics for SEI messages.

For SEI messages for which the specified syntax structure is empty, such as the dependent random access point SEI message, the mere indication that the SEI message is present (e.g., as indicated by a payload type indicator) is sufficient to convey the associated information (e.g., by indicating that a set of specified constraints are fulfilled).

The semantics and persistence scope for each SEI message are specified in the semantics specification for each particular SEI message.

NOTE – Persistence information for SEI messages is summarized in Table 4.

**Table 4 – Persistence scope of SEI messages (informative)**

SEI message	Persistence scope
Filler payload	The PU containing the SEI message
User data registered by Rec. ITU-T T.35	Unspecified
User data unregistered	Unspecified
Film grain characteristics	Specified by the syntax of the SEI message
Frame packing arrangement	Specified by the syntax of the SEI message
Referenced parameter sets	The CLVS containing the SEI message
Decoded picture hash	The PU containing the SEI message
Mastering display colour volume	The CLVS containing the SEI message
Content light level information	The CLVS containing the SEI message

**Table 4 – Persistence scope of SEI messages (informative)**

SEI message	Persistence scope
DRAP indication	The PU containing the SEI message
Alternative transfer characteristics	The CLVS containing the SEI message
Ambient viewing environment	The CLVS containing the SEI message
Content colour volume	Specified by the syntax of the SEI message
Equirectangular projection	Specified by the syntax of the SEI message
Generalized cubemap projection	Specified by the syntax of the SEI message
Sphere rotation	Specified by the syntax of the SEI message
Region-wise packing	Specified by the syntax of the SEI message
Omnidirectional viewport	Specified by the syntax of the SEI message
Frame-field information	The PU containing the SEI message
Sample aspect ratio information	Specified by the syntax of the SEI message

In the semantics of a particular SEI message, the phrase "the current layer" in the semantics refer to the layer that the particular SEI message is associated with, the phrase "the current picture" refer to the picture that the particular SEI message is associated with, and the phrase "the current CLVS" or "the CLVS" refers to the CLVS containing the current picture. The association of an SEI message to a layer or a picture is specified in a video coding specification that specifies a coded video bitstream with which the SEI messages are used.

The values of some SEI message syntax elements, including `fp_arrangement_id` and `omni_viewport_id`, are split into two sets of value ranges, where the first set is specified as "may be used as determined by the application", and the second set is specified as "reserved for future use by ITU-T | ISO/IEC". Applications should be cautious of potential "collisions" of the interpretation for values of these syntax elements belonging to the first set of value ranges. Since different applications might use these IDs having values in the first set of value ranges for different purposes, particular care should be exercised in the design of encoders that generate SEI messages with these IDs having values in the first set of value ranges, and in the design of decoders that interpret SEI messages with these IDs. This Specification does not define any management for these values. These IDs having values in the first set of value ranges might only be suitable for use in contexts in which "collisions" of usage (i.e., different definitions of the syntax and semantics of an SEI message with one of these IDs having the same value in the first set of value ranges) are unimportant, or not possible, or are managed – e.g., defined or managed in the controlling application or transport specification, or by controlling the environment in which bitstreams are distributed.

## 8.2 Filler payload SEI message

### 8.2.1 Filler payload SEI message syntax

<code>filler_payload( payloadSize ) {</code>	<b>Descriptor</b>
<code>  for( k = 0; k &lt; payloadSize; k++ )</code>	
<code>    <b>ff_byte</b> /* equal to 0xFF */</code>	f(8)
<code>}</code>	

### 8.2.2 Filler payload SEI message semantics

This SEI message contains a series of `payloadSize` bytes of value 0xFF, which can be discarded.

**ff\_byte** shall be a byte having the value 0xFF.

### 8.3 User data registered by Recommendation ITU-T T.35 SEI message

#### 8.3.1 User data registered by Recommendation ITU-T T.35 SEI message syntax

	Descriptor
<code>user_data_registered_itu_t_t35( payloadSize ) {</code>	
<code>  <b>itu_t_t35_country_code</b></code>	b(8)
<code>  if( itu_t_t35_country_code != 0xFF )</code>	
<code>    i = 1</code>	
<code>  else {</code>	
<code>    <b>itu_t_t35_country_code_extension_byte</b></code>	b(8)
<code>    i = 2</code>	
<code>  }</code>	
<code>  do {</code>	
<code>    <b>itu_t_t35_payload_byte</b></code>	b(8)
<code>    i++</code>	
<code>  } while( i &lt; payloadSize )</code>	
<code>}</code>	

#### 8.3.2 User data registered by Recommendation ITU-T T.35 SEI message semantics

This SEI message contains user data registered as specified in Recommendation ITU-T T.35, the contents of which are not specified in this Specification.

**itu\_t\_t35\_country\_code** shall be a byte having a value specified as a country code by Recommendation ITU-T T.35:2000, Annex A.

**itu\_t\_t35\_country\_code\_extension\_byte** shall be a byte having a value specified as a country code by Recommendation ITU-T T.35:2000, Annex B.

**itu\_t\_t35\_payload\_byte** shall be a byte containing data registered as specified in Recommendation ITU-T T.35.

The ITU-T T.35 terminal provider code and terminal provider oriented code shall be contained in the first one or more bytes of the **itu\_t\_t35\_payload\_byte**, in the format specified by the Administration that issued the terminal provider code. Any remaining **itu\_t\_t35\_payload\_byte** data shall be data having syntax and semantics as specified by the entity identified by the ITU-T T.35 country code and terminal provider code.

### 8.4 User data unregistered SEI message

#### 8.4.1 User data unregistered SEI message syntax

	Descriptor
<code>user_data_unregistered( payloadSize ) {</code>	
<code>  <b>uuid_iso_iec_11578</b></code>	u(128)
<code>  for( i = 16; i &lt; payloadSize; i++ )</code>	
<code>    <b>user_data_payload_byte</b></code>	b(8)
<code>}</code>	

#### 8.4.2 User data unregistered SEI message semantics

This SEI message contains unregistered user data identified by a universal unique identifier (UUID), the contents of which are not specified in this Specification.

**uuid\_iso\_iec\_11578** shall have a value specified as a UUID according to the procedures of ISO/IEC 11578:1996, Annex A.

**user\_data\_payload\_byte** shall be a byte containing data having syntax and semantics as specified by the UUID generator.

}	
}	
<b>fg_characteristics_persistence_flag</b>	u(1)
}	
}	

### 8.5.2 Film grain characteristics SEI message semantics

This SEI message provides the decoder with a parameterized model for film grain synthesis.

NOTE 1 – For example, an encoder could use the film grain characteristics SEI message to characterize film grain that was present in the original source video material and was removed by pre-processing filtering techniques. Synthesis of simulated film grain on the decoded images for the display process is optional and does not need to exactly follow the specified semantics of the film grain characteristics SEI message. When synthesis of simulated film grain on the decoded images for the display process is performed, there is no requirement that the method by which the synthesis is performed be the same as the parameterized model for the film grain as provided in the film grain characteristics SEI message.

NOTE 2 – The display process is not specified in this Specification.

NOTE 3 – SMPTE RDD 5 specifies a film grain simulator based on the information provided in the film grain characteristics SEI message.

Use of this SEI message requires the definition of the following variables:

- A picture width and picture height in units of luma samples, denoted herein by `PicWidthInLumaSamples` and `PicHeightInLumaSamples`, respectively.

- When the syntax element `fg_separate_colour_description_present_flag` of the film grain characteristics SEI message is equal to 0, the following additional variables:
  - A chroma format indicator, denoted herein by `ChromaFormatIdc`, as described in clause 7.3.
  - A bit depth for the samples of the luma component, denoted herein by `BitDepthY`, and when `ChromaFormatIdc` is not equal to 0, a bit depth for the samples of the two associated chroma components, denoted herein by `BitDepthC`.

The film grain models specified in the film grain characteristics SEI message are expressed for application to decoded pictures that have 4:4:4 colour format with luma and chroma bit depths corresponding to the luma and chroma bit depths of the film grain model and use the same colour representation domain as the identified film grain model. When the colour format of the decoded video is not 4:4:4 or the decoded video uses a different luma or chroma bit depth from that of the film grain model or uses a different colour representation domain from that of the identified film grain model, an unspecified conversion process is expected to be applied to convert the decoded pictures to the form that is expressed for application of the film grain model.

NOTE 4 – Because the use of a specific method is not required for performing the film grain generation function used by the display process, a decoder could, if desired, down-convert the model information for chroma in order to simulate film grain for other chroma formats (4:2:0 or 4:2:2) rather than up-converting the decoded video (using a method not specified in this Specification) before performing film grain generation.

`fg_characteristics_cancel_flag` equal to 1 indicates that the SEI message cancels the persistence of any previous film grain characteristics SEI message in output order that applies to the current layer. `fg_characteristics_cancel_flag` equal to 0 indicates that film grain modelling information follows.

`fg_model_id` identifies the film grain simulation model as specified in Table 5. The value of `fg_model_id` shall be in the range of 0 to 1, inclusive. The values of 2 and 3 for `fg_model_id` are reserved for future use by ITU-T | ISO/IEC and shall not be present in bitstreams conforming to this version of this Specification. Decoders shall ignore film grain characteristic SEI messages with `fg_model_id` equal to 2 or 3.

**Table 5 – fg\_model\_id values**

Value	Description
0	Frequency filtering
1	Auto-regression

`fg_separate_colour_description_present_flag` equal to 1 indicates that a distinct combination of luma bit depth, chroma bit depth, video full range flag, colour primaries, transfer characteristics, and matrix coefficients for the film grain characteristics specified in the SEI message is present in the film grain characteristics SEI message syntax. `fg_separate_colour_description_present_flag` equal to 0 indicates that the combination of luma bit depth, chroma bit depth, video full range flag, colour primaries, transfer characteristics, and matrix coefficients for the film grain characteristics specified in the SEI message are the same as indicated in VUI parameters for the CLVS.

NOTE 5 – When `fg_separate_colour_description_present_flag` is equal to 1, any of the luma bit depth, chroma bit depth, video full range flag, colour primaries, transfer characteristics, and matrix coefficients specified for the film grain characteristics specified in the SEI message could differ from that for the pictures in the CLVS.

When VUI parameters are not present for the CLVS or the value of `vui_colour_description_present_flag` is equal to 0, and equivalent information to that conveyed when `vui_colour_description_present_flag` is equal to 1 is not conveyed by external means, `fg_separate_colour_description_present_flag` shall be equal to 1.

The decoded image  $I_{\text{decoded}}$  used in the equations in this clause is in the same colour representation domain as the simulated film grain signal. Therefore, when any of these parameters does differ from that for the pictures in CLVS, the decoded image  $I_{\text{decoded}}$  used in the equations in this clause would be in a different colour representation domain than that for the pictures in the CLVS. For example, when the value of `fg_bit_depth_luma_minus8` + 8 is greater than `BitDepthY` (i.e., the bit depth of the luma component of the pictures in the CLVS), the bit depth of  $I_{\text{decoded}}$  used in the equations in this clause is also greater than `BitDepthY`. In such a case, the decoded image  $I_{\text{decoded}}$  corresponding to an actual decoded picture would be generated by converting the actual decoded picture to be in the same colour representation domain as the simulated film grain signal. The process for converting an actual decoded picture to the 4:4:4 colour format with same colour representation domain as the simulated film grain signal is not specified in this Specification.

`fg_bit_depth_luma_minus8` plus 8 specifies the bit depth used for the luma component of the film grain characteristics specified in the SEI message. When `fg_bit_depth_luma_minus8` is not present in the film grain characteristics SEI message, the value of `fg_bit_depth_luma_minus8` is inferred to be equal to `BitDepthY – 8`.

The value of `fgBitDepth[ 0 ]` is derived as follows:

$$\text{fgBitDepth}[ 0 ] = \text{fg\_bit\_depth\_luma\_minus8} + 8 \quad (16)$$

**fg\_bit\_depth\_chroma\_minus8** plus 8 specifies the bit depth used for the Cb and Cr components of the film grain characteristics specified in the SEI message. When **fg\_bit\_depth\_chroma\_minus8** is not present in the film grain characteristics SEI message, the value of **fg\_bit\_depth\_chroma\_minus8** is inferred to be equal to  $\text{BitDepth}_C - 8$ .

The value of **fgBitDepth[ c ]** for  $c = 1$  and  $2$  is derived as follows:

$$\text{fgBitDepth}[ c ] = \text{fg\_bit\_depth\_chroma\_minus8} + 8, \text{ with } c = 1, 2 \quad (17)$$

**fg\_full\_range\_flag** has the same semantics as specified in clause 7.3 for the **vui\_full\_range\_flag** syntax element, except as follows:

- **fg\_full\_range\_flag** specifies the video full range flag of the film grain characteristics specified in the SEI message, rather than the video full range flag used for the CLVS.
- When **fg\_full\_range\_flag** is not present in the film grain characteristics SEI message, the value of **fg\_full\_range\_flag** is inferred to be equal to **vui\_full\_range\_flag**.

**fg\_colour\_primaries** has the same semantics as specified in clause 7.3 for the **vui\_colour\_primaries** syntax element, except as follows:

- **fg\_colour\_primaries** specifies the colour primaries of the film grain characteristics specified in the SEI message, rather than the colour primaries used for the CLVS.
- When **fg\_colour\_primaries** is not present in the film grain characteristics SEI message, the value of **fg\_colour\_primaries** is inferred to be equal to **vui\_colour\_primaries**.

**fg\_transfer\_characteristics** has the same semantics as specified in clause 7.3 for the **vui\_transfer\_characteristics** syntax element, except as follows:

- **fg\_transfer\_characteristics** specifies the transfer characteristics of the film grain characteristics specified in the SEI message, rather than the transfer characteristics used for the CLVS.
- When **fg\_transfer\_characteristics** is not present in the film grain characteristics SEI message, the value of **fg\_transfer\_characteristics** is inferred to be equal to **vui\_transfer\_characteristics**.

**fg\_matrix\_coeffs** has the same semantics as specified in clause 7.3 for the **vui\_matrix\_coeffs** syntax element, except as follows:

- **fg\_matrix\_coeffs** specifies the matrix coefficients of the film grain characteristics specified in the SEI message, rather than the matrix coefficients used for the CLVS.
- When **fg\_matrix\_coeffs** is not present in the film grain characteristics SEI message, the value of **fg\_matrix\_coeffs** is inferred to be equal to **vui\_matrix\_coeffs**.
- The values allowed for **fg\_matrix\_coeffs** are not constrained by the chroma format of the decoded video pictures that is indicated by the value of **ChromaFormatIdc** for the semantics of the VUI parameters.

**fg\_blending\_mode\_id** identifies the blending mode used to blend the simulated film grain with the decoded images as specified in Table 6. **fg\_blending\_mode\_id** shall be in the range of 0 to 1, inclusive. The values of 2 and 3 for **fg\_blending\_mode\_id** are reserved for future use by ITU-T | ISO/IEC and shall not be present in bitstreams conforming to this version of this Specification. Decoders shall ignore film grain characteristic SEI messages with **fg\_blending\_mode\_id** equal to 2 or 3.

**Table 6 – fg\_blending\_mode\_id values**

Value	Description
0	Additive
1	Multiplicative

Depending on the value of **fg\_blending\_mode\_id**, the blending mode is specified as follows:

- If **fg\_blending\_mode\_id** is equal to 0, the blending mode is additive as specified by:

$$I_{\text{grain}}[ c ][ x ][ y ] = \text{Clip3}( 0, ( 1 \ll \text{fgBitDepth}[ c ] ) - 1, I_{\text{decoded}}[ c ][ x ][ y ] + G[ c ][ x ][ y ] ) \quad (18)$$

- Otherwise (**fg\_blending\_mode\_id** is equal to 1), the blending mode is multiplicative as specified by:

$$I_{\text{grain}}[c][x][y] = \text{Clip3}(0, (1 \ll \text{fgBitDepth}[c]) - 1, I_{\text{decoded}}[c][x][y] + \text{Round}((I_{\text{decoded}}[c][x][y] * G[c][x][y]) \div ((1 \ll \text{fgBitDepth}[c]) - 1))) \quad (19)$$

where  $I_{\text{decoded}}[c][x][y]$  represents the sample value at coordinates  $x, y$  of the colour component  $c$  of the decoded image  $I_{\text{decoded}}$ ,  $G[c][x][y]$  is the simulated film grain value at the same position and colour component, and  $\text{fgBitDepth}[c]$  is the number of bits used for each sample in a fixed-length unsigned binary representation of the arrays  $I_{\text{grain}}[c][x][y]$ ,  $I_{\text{decoded}}[c][x][y]$ , and  $G[c][x][y]$ , where  $c = 0..2$ ,  $x = 0..\text{PicWidthInLumaSamples} - 1$ , and  $y = 0..\text{PicHeightInLumaSamples} - 1$ .

**fg\_log2\_scale\_factor** specifies a scale factor used in the film grain characterization equations.

**fg\_comp\_model\_present\_flag**[ $c$ ] equal to 0 indicates that film grain is not modelled on the  $c$ -th colour component, where  $c$  equal to 0 refers to the luma component,  $c$  equal to 1 refers to the Cb component, and  $c$  equal to 2 refers to the Cr component. **fg\_comp\_model\_present\_flag**[ $c$ ] equal to 1 indicates that syntax elements specifying modelling of film grain on colour component  $c$  are present in the SEI message.

When **fg\_separate\_colour\_description\_present\_flag** is equal to 0 and **ChromaFormatIdc** is equal to 0, the value of **fg\_comp\_model\_present\_flag**[ 1 ] and **fg\_comp\_model\_present\_flag**[ 2 ] shall be equal to 0.

**fg\_num\_intensity\_intervals\_minus1**[ $c$ ] plus 1 specifies the number of intensity intervals for which a specific set of model values has been estimated.

NOTE 6 – The intensity intervals could overlap in order to simulate multi-generational film grain.

**fg\_num\_model\_values\_minus1**[ $c$ ] plus 1 specifies the number of model values present for each intensity interval in which the film grain has been modelled. The value of **fg\_num\_model\_values\_minus1**[ $c$ ] shall be in the range of 0 to 5, inclusive.

**fg\_intensity\_interval\_lower\_bound**[ $c$ ][ $i$ ] specifies the lower bound of the  $i$ -th intensity interval for which the set of model values applies.

**fg\_intensity\_interval\_upper\_bound**[ $c$ ][ $i$ ] specifies the upper bound of the  $i$ -th intensity interval for which the set of model values applies.

The variable **intensityIntervalIdx**[ $c$ ][ $x$ ][ $y$ ][ $j$ ] represents the  $j$ -th index to the list of intensity intervals selected for the sample value  $I_{\text{decoded}}[c][x][y]$  for  $c = 0..2$ ,  $x = 0..\text{PicWidthInLumaSamples} - 1$ ,  $y = 0..\text{PicHeightInLumaSamples} - 1$ , and  $j = 0..\text{numApplicableIntensityIntervals}[c][x][y] - 1$ , where **numApplicableIntensityIntervals**[ $c$ ][ $x$ ][ $y$ ] is derived below.

Depending on the value of **fg\_model\_id**, the selection of the one or more intensity intervals for the sample value  $I_{\text{decoded}}[c][x][y]$  is specified as follows:

- The variable **numApplicableIntensityIntervals**[ $c$ ][ $x$ ][ $y$ ] is initially set equal to 0.
- If **fg\_model\_id** is equal to 0, the following applies:
  - The top-left sample location ( $x_B, y_B$ ) of the current 8x8 block  $b$  that contains the sample value  $I_{\text{decoded}}[c][x][y]$  is derived as  $(x_B, y_B) = (x / 8, y / 8)$ .
  - The average value  $b_{\text{avg}}$  of the current 8x8 block  $b$  is derived as follows:

$$\begin{aligned} \text{sum}_{8 \times 8} &= 0 \\ \text{for}(i = 0; i < 8; i++) \\ &\quad \text{for}(j = 0; j < 8; j++) \\ &\quad\quad \text{sum}_{8 \times 8} += I_{\text{decoded}}[c][x_B * 8 + i][y_B * 8 + j] \\ b_{\text{avg}} &= \text{Clip3}(0, 255, (\text{sum}_{8 \times 8} + (1 \ll (\text{fgBitDepth}[c] - 3))) \gg (\text{fgBitDepth}[c] - 2)) \end{aligned} \quad (20)$$

- The value of **intensityIntervalIdx**[ $c$ ][ $x$ ][ $y$ ][ $j$ ] is derived as follows:

$$\begin{aligned} &\text{for}(i = 0, j = 0; i \leq \text{fg\_num\_intensity\_intervals\_minus1}[c]; i++) \\ &\quad \text{if}(b_{\text{avg}} \geq \text{fg\_intensity\_interval\_lower\_bound}[c][i] \ \&\& \\ &\quad\quad b_{\text{avg}} \leq \text{fg\_intensity\_interval\_upper\_bound}[c][i]) \{ \\ &\quad\quad\quad \text{intensityIntervalIdx}[c][x][y][j] = i \\ &\quad\quad\quad j++ \\ &\quad\quad\quad \} \\ &\quad\quad \} \\ \text{numApplicableIntensityIntervals}[c][x][y] &= j \end{aligned} \quad (21)$$

- Otherwise (**fg\_model\_id** is equal to 1), the value of **intensityIntervalIdx**[ $c$ ][ $x$ ][ $y$ ][ $j$ ] is derived as follows:

```

I8[ c ][ x ][ y ] = ( fgBitDepth[ c ] == 8 ) ? ( Idecoded[ c ][ x ][ y ] :
Clip3( 0, 255, ( Idecoded[ c ][ x ][ y ] + ( 1 << ( fgBitDepth[ c ] - 9 ) ) ) >> ( fgBitDepth[ c ] - 8 ) )
for( i = 0, j = 0; i <= fg_num_intensity_intervals_minus1[ c ]; i++ )
    if( I8[ c ][ x ][ y ] >= fg_intensity_interval_lower_bound[ c ][ i ] &&
        I8[ c ][ x ][ y ] <= fg_intensity_interval_upper_bound[ c ][ i ] ) {
        intensityIntervalIdx[ c ][ x ][ y ][ j ] = i
        j++
    }
numApplicableIntensityIntervals[ c ][ x ][ y ] = j

```

Samples that do not fall into any of the defined intervals (i.e., those samples for which the value of numApplicableIntensityIntervals[ c ][ x ][ y ] is equal to 0) are not modified by the grain generation function. Samples that fall into more than one interval (i.e., those samples for which the value of numApplicableIntensityIntervals[ c ][ x ][ y ] is greater than 1) will originate multi-generation grain. Multi-generation grain results from adding the grain computed independently for each of the applicable intensity intervals.

In the equations in the remainder of this clause, the variable  $s_j$  in each instance of the list fg\_comp\_model\_value[ c ][ s<sub>j</sub> ] is the value of intensityIntervalIdx[ c ][ x ][ y ][ j ] derived for the sample value Idecoded[ c ][ x ][ y ].

**fg\_comp\_model\_value[ c ][ i ][ j ]** specifies the j-th model value for the colour component c and the i-th intensity interval. The set of model values has different meaning depending on the value of fg\_model\_id.

The value of fg\_comp\_model\_value[ c ][ i ][ j ] is constrained as follows, and could be additionally constrained as specified elsewhere in this clause:

- If fg\_model\_id is equal to 0, fg\_comp\_model\_value[ c ][ i ][ j ] shall be in the range of 0 to  $2^{\text{fgBitDepth}[c]} - 1$ , inclusive.
- Otherwise (fg\_model\_id is equal to 1), fg\_comp\_model\_value[ c ][ i ][ j ] shall be in the range of  $-2^{(\text{fgBitDepth}[c]-1)}$  to  $2^{(\text{fgBitDepth}[c]-1)} - 1$ , inclusive.

Depending on the value of fg\_model\_id, the synthesis of the film grain is modelled as follows:

- If fg\_model\_id is equal to 0, a frequency filtering model enables simulating the original film grain for  $c = 0..2$ ,  $x = 0..PicWidthInLumaSamples - 1$ , and  $y = 0..PicHeightInLumaSamples - 1$  as specified by:

$$G[ c ][ x ][ y ] = ( \text{fg\_comp\_model\_value}[ c ][ s_j ][ 0 ] * Q[ c ][ x ][ y ] + \text{fg\_comp\_model\_value}[ c ][ s_j ][ 5 ] * G[ c - 1 ][ x ][ y ] ) \gg \text{fg\_log2\_scale\_factor} \quad (23)$$

where  $Q[ c ]$  is a two-dimensional random process generated by filtering 16x16 blocks gaussRv with random-value elements gaussRv<sub>ij</sub> generated with a normalized Gaussian distribution (independent and identically distributed Gaussian random variable samples with zero mean and unity variance) and where the value of an element  $G[ c - 1 ][ x ][ y ]$  used in the right-hand side of the equation is inferred to be equal to 0 when  $c - 1$  is less than 0.

NOTE 7 – A normalized Gaussian random variable can be generated from two independent, uniformly distributed random values over the interval from 0 to 1 (and not equal to 0), denoted as uRv<sub>0</sub> and uRv<sub>1</sub>, using the Box-Muller transformation specified by:

$$\text{gaussRv}_{ij} = \text{Sqrt}( -2 * \text{Ln}( \text{uRv}_0 ) ) * \text{Cos}( 2 * \pi * \text{uRv}_1 ) \quad (24)$$

where  $\pi$  is Archimedes' constant 3.141 592 653 589 793....

The band-pass filtering of blocks gaussRv can be performed in the discrete cosine transform (DCT) domain as follows:

```

for( y = 0; y < 16; y++ )
    for( x = 0; x < 16; x++ )
        if( ( x < fg_comp_model_value[ c ][ s_j ][ 3 ] && y < fg_comp_model_value[ c ][ s_j ][ 4 ] ) ||
            x > fg_comp_model_value[ c ][ s_j ][ 1 ] || y > fg_comp_model_value[ c ][ s_j ][ 2 ] )
            gaussRv[ x ][ y ] = 0
filteredRv = IDCT16x16( gaussRv )

```

where IDCT16x16( z ) refers to a unitary inverse discrete cosine transformation (IDCT) operating on a 16x16 matrix argument z as specified by:

$$\text{IDCT16x16}( z ) = r * z * r^T \quad (26)$$

where the superscript T indicates a matrix transposition and r is the 16x16 matrix with elements r<sub>ij</sub> specified by:

$$\Gamma_{i,j} = \frac{((i = 0) ? 1 : \text{Sqrt}(2))}{4} * \text{Cos}\left(\frac{i * (2 * j + 1) * \pi}{32}\right) \quad (27)$$

where  $\pi$  is Archimedes' constant 3.141 592 653 589 793....

Q[ c ] is formed by the frequency-filtered blocks filteredRv.

NOTE 8 – Coded model values are based on blocks of size 16x16, but a decoder implementation could use other block sizes. For example, decoders implementing the IDCT on 8x8 blocks could down-convert by a factor of two the set of coded model values fg\_comp\_model\_value[ c ][ s<sub>j</sub> ][ i ] for i equal to 1..4.

NOTE 9 – To reduce the degree of visible blocks that result from mosaicking the frequency-filtered blocks filteredRv, decoders could apply a low-pass filter to the boundaries between frequency-filtered blocks.

- Otherwise (fg\_model\_id is equal to 1), an auto-regression model enables simulating the original film grain for c = 0..2, x = 0..PicWidthInLumaSamples – 1, and y = 0..PicHeightInLumaSamples – 1 as specified by:

$$\begin{aligned} G[ c ][ x ][ y ] = & ( fg\_comp\_model\_value[ c ][ s_j ][ 0 ] * n[ c ][ x ][ y ] + \\ & fg\_comp\_model\_value[ c ][ s_j ][ 1 ] * ( G[ c ][ x - 1 ][ y ] + \\ & ( ( fg\_comp\_model\_value[ c ][ s_j ][ 4 ] * G[ c ][ x ][ y - 1 ] ) >> \\ & fg\_log2\_scale\_factor ) ) + fg\_comp\_model\_value[ c ][ s_j ][ 3 ] * \\ & ( ( ( fg\_comp\_model\_value[ c ][ s_j ][ 4 ] * G[ c ][ x - 1 ][ y - 1 ] ) >> \\ & fg\_log2\_scale\_factor ) + G[ c ][ x + 1 ][ y - 1 ] ) + \\ & fg\_comp\_model\_value[ c ][ s_j ][ 5 ] * ( G[ c ][ x - 2 ][ y ] + \\ & ( ( fg\_comp\_model\_value[ c ][ s_j ][ 4 ] * fg\_comp\_model\_value[ c ][ s_j ][ 4 ] * G[ c ][ x ][ y - 2 ] ) >> \\ & ( 2 * fg\_log2\_scale\_factor ) ) ) + \\ & fg\_comp\_model\_value[ c ][ s_j ][ 2 ] * G[ c - 1 ][ x ][ y ] ) >> fg\_log2\_scale\_factor \end{aligned} \quad (28)$$

where n[ c ][ x ][ y ] is a random value with normalized Gaussian distribution (independent and identically distributed Gaussian random variable samples with zero mean and unity variance for each value of c, x, and y) and the value of an element G[ c ][ x ][ y ] used in the right-hand side of the equation is inferred to be equal to 0 when any of the following conditions are true:

- c is less than 0,
- x is less than 0,
- y is less than 0.

fg\_comp\_model\_value[ c ][ i ][ 0 ] provides the first model value for the model as specified by fg\_model\_id. fg\_comp\_model\_value[ c ][ i ][ 0 ] corresponds to the standard deviation of the Gaussian noise term in the generation functions specified in Equations 23 through 28.

fg\_comp\_model\_value[ c ][ i ][ 1 ] provides the second model value for the model as specified by fg\_model\_id. When fg\_model\_id is equal to 0, fg\_comp\_model\_value[ c ][ i ][ 1 ] shall be greater than or equal to 0 and less than 16.

When not present in the film grain characteristics SEI message, fg\_comp\_model\_value[ c ][ i ][ 1 ] is inferred as follows:

- If fg\_model\_id is equal to 0, fg\_comp\_model\_value[ c ][ i ][ 1 ] is inferred to be equal to 8.
- Otherwise (fg\_model\_id is equal to 1), fg\_comp\_model\_value[ c ][ i ][ 1 ] is inferred to be equal to 0.

fg\_comp\_model\_value[ c ][ i ][ 1 ] is interpreted as follows:

- If fg\_model\_id is equal to 0, fg\_comp\_model\_value[ c ][ i ][ 1 ] indicates the horizontal high cut frequency to be used to filter the DCT of a block of 16x16 random values.
- Otherwise (fg\_model\_id is equal to 1), fg\_comp\_model\_value[ c ][ i ][ 1 ] indicates the first order spatial correlation for neighbouring samples ( x – 1, y ) and ( x, y – 1 ).

fg\_comp\_model\_value[ c ][ i ][ 2 ] provides the third model value for the model as specified by fg\_model\_id. When fg\_model\_id is equal to 0, fg\_comp\_model\_value[ c ][ i ][ 2 ] shall be greater than or equal to 0 and less than 16.

When not present in the film grain characteristics SEI message, fg\_comp\_model\_value[ c ][ i ][ 2 ] is inferred as follows:

- If fg\_model\_id is equal to 0, fg\_comp\_model\_value[ c ][ i ][ 2 ] is inferred to be equal to fg\_comp\_model\_value[ c ][ i ][ 1 ]
- Otherwise (fg\_model\_id is equal to 1), fg\_comp\_model\_value[ c ][ i ][ 2 ] is inferred to be equal to 0.

fg\_comp\_model\_value[ c ][ i ][ 2 ] is interpreted as follows:

- If fg\_model\_id is equal to 0, fg\_comp\_model\_value[ c ][ i ][ 2 ] indicates the vertical high cut frequency to be used to filter the DCT of a block of 16x16 random values.

- Otherwise (fg\_model\_id is equal to 1), fg\_comp\_model\_value[ c ][ i ][ 2 ] indicates the colour correlation between consecutive colour components.

fg\_comp\_model\_value[ c ][ i ][ 3 ] provides the fourth model value for the model as specified by fg\_model\_id. When fg\_model\_id is equal to 0, fg\_comp\_model\_value[ c ][ i ][ 3 ] shall be greater than or equal to 0 and less than or equal to fg\_comp\_model\_value[ c ][ i ][ 1 ].

When not present in the film grain characteristics SEI message, fg\_comp\_model\_value[ c ][ i ][ 3 ] is inferred to be equal to 0.

fg\_comp\_model\_value[ c ][ i ][ 3 ] is interpreted as follows:

- If fg\_model\_id is equal to 0, fg\_comp\_model\_value[ c ][ i ][ 3 ] indicates the horizontal low cut frequency to be used to filter the DCT of a block of 16x16 random values.
- Otherwise (fg\_model\_id is equal to 1), fg\_comp\_model\_value[ c ][ i ][ 3 ] indicates the first order spatial correlation for neighbouring samples ( x - 1, y - 1 ) and ( x + 1, y - 1 ).

fg\_comp\_model\_value[ c ][ i ][ 4 ] provides the fifth model value for the model as specified by fg\_model\_id. When fg\_model\_id is equal to 0, fg\_comp\_model\_value[ c ][ i ][ 4 ] shall be greater than or equal to 0 and less than or equal to fg\_comp\_model\_value[ c ][ i ][ 2 ].

When not present in the film grain characteristics SEI message, fg\_comp\_model\_value[ c ][ i ][ 4 ] is inferred to be equal to fg\_model\_id.

fg\_comp\_model\_value[ c ][ i ][ 4 ] is interpreted as follows:

- If fg\_model\_id is equal to 0, fg\_comp\_model\_value[ c ][ i ][ 4 ] indicates the vertical low cut frequency to be used to filter the DCT of a block of 16x16 random values.
- Otherwise (fg\_model\_id is equal to 1), fg\_comp\_model\_value[ c ][ i ][ 4 ] indicates the aspect ratio of the modelled grain.

fg\_comp\_model\_value[ c ][ i ][ 5 ] provides the sixth model value for the model as specified by fg\_model\_id.

When not present in the film grain characteristics SEI message, fg\_comp\_model\_value[ c ][ i ][ 5 ] is inferred to be equal to 0.

fg\_comp\_model\_value[ c ][ i ][ 5 ] is interpreted as follows:

- If fg\_model\_id is equal to 0, fg\_comp\_model\_value[ c ][ i ][ 5 ] indicates the colour correlation between consecutive colour components.
- Otherwise (fg\_model\_id is equal to 1), fg\_comp\_model\_value[ c ][ i ][ 5 ] indicates the second order spatial correlation for neighbouring samples ( x, y - 2 ) and ( x - 2, y ).

**fg\_characteristics\_persistence\_flag** specifies the persistence of the film grain characteristics SEI message for the current layer.

fg\_characteristics\_persistence\_flag equal to 0 specifies that the film grain characteristics SEI message applies to the current decoded picture only.

fg\_characteristics\_persistence\_flag equal to 1 specifies that the film grain characteristics SEI message applies to the current decoded picture and persists for all subsequent pictures of the current layer in output order until one or more of the following conditions are true:

- A new CLVS of the current layer begins.
- The bitstream ends.
- A picture in the current layer in an AU associated with a film grain characteristics SEI message is output that follows the current picture in output order.

## 8.6 Frame packing arrangement SEI message

### 8.6.1 Frame packing arrangement SEI message syntax

### 8.6.2 Frame packing arrangement SEI message semantics

This SEI message informs the decoder that the cropped decoded picture contains samples of multiple distinct spatially packed constituent frames that are packed into one frame, or that the output cropped decoded pictures in output order form a temporal interleaving of alternating first and second constituent frames, using an indicated frame packing arrangement scheme. This information can be used by the decoder to appropriately rearrange the samples and process the samples of the constituent frames appropriately for display or other purposes (which are outside the scope of this Specification).

This SEI message may be associated with pictures that are either frames or fields (as determined outside the scope of this Specification). The frame packing arrangement of the samples is specified in terms of the sampling structure of a frame in order to define a frame packing arrangement structure that is invariant with respect to whether a picture is a single field of such a packed frame or is a complete packed frame.

**fp\_arrangement\_id** contains an identifying number that may be used to identify the usage of the frame packing arrangement SEI message. The value of **fp\_arrangement\_id** shall be in the range of 0 to  $2^{32} - 2$ , inclusive.

Values of **fp\_arrangement\_id** from 0 to 255, inclusive, and from 512 to  $2^{31} - 1$ , inclusive, may be used as determined by the application. Values of **fp\_arrangement\_id** from 256 to 511, inclusive, and from  $2^{31}$  to  $2^{32} - 2$ , inclusive, are reserved for future use by ITU-T | ISO/IEC. Decoders encountering a value of **fp\_arrangement\_id** in the range of 256 to 511, inclusive, or in the range of  $2^{31}$  to  $2^{32} - 2$ , inclusive, shall ignore it.

**fp\_arrangement\_cancel\_flag** equal to 1 indicates that the frame packing arrangement SEI message cancels the persistence of any previous frame packing arrangement SEI message in output order that applies to the current layer. **fp\_arrangement\_cancel\_flag** equal to 0 indicates that frame packing arrangement information follows.

**fp\_arrangement\_type** identifies the indicated interpretation of the sample arrays of the output cropped decoded picture as specified in Table 7.

When **fp\_arrangement\_type** is equal to 3 or 4, each component plane of the output cropped decoded picture contains all samples (when **ffi\_field\_pic\_flag** is equal to 0) or the samples corresponding to the top or bottom field (when **ffi\_field\_pic\_flag** is equal to 1) of the samples of a frame packing arrangement structure.

**Table 7 – Definition of fp\_arrangement\_type**

Value	Interpretation
3	The frame packing arrangement structure contains a side-by-side packing arrangement of corresponding planes of two constituent frames as illustrated in Figure 6, Figure 7 and Figure 10.
4	The frame packing arrangement structure contains a top-bottom packing arrangement of corresponding planes of two constituent frames as illustrated in Figure 8 and Figure 9.
5	The component planes of the output cropped decoded pictures in output order form a temporal interleaving of alternating first and second constituent frames as illustrated in Figure 11.

NOTE 1 – Figure 6 to Figure 10 provide typical examples of rearrangement and upconversion processing for various packing arrangement schemes. Actual characteristics of the constituent frames are signalled in detail by the subsequent syntax elements of the frame packing arrangement SEI message. In Figure 6 to Figure 10, an upconversion processing is performed on each constituent frame to produce frames having the same resolution as that of the decoded frame. An example of the upsampling method to be applied to a quincunx sampled frame as shown in Figure 10 is to fill in missing positions with an average of the available spatially neighbouring samples (the average of the values of the available samples above, below, to the left and to the right of each sample to be generated). The actual upconversion process to be performed, if any, is outside the scope of this Specification.

NOTE 2 – When the output time of the samples of constituent frame 0 differs from the output time of the samples of constituent frame 1 (i.e., when fp\_field\_views\_flag is equal to 1 or fp\_arrangement\_type is equal to 5) and the display system in use presents two views simultaneously, the display time for constituent frame 0 could be delayed to coincide with the display time for constituent frame 1. (The display process is not specified in this Specification.)

NOTE 3 – When fp\_field\_views\_flag is equal to 1 or fp\_arrangement\_type is equal to 5, the value 0 for fixed\_pic\_rate\_within\_cvs\_flag is not expected to be prevalent in industry use of this SEI message.

NOTE 4 – fp\_arrangement\_type equal to 5 describes a temporal interleaving process of different views.

All other values of fp\_arrangement\_type are reserved for future use by ITU-T | ISO/IEC. It is a requirement of bitstream conformance that bitstreams conforming to this version of this Specification shall not contain such other values of fp\_arrangement\_type. Decoders shall ignore frame packing arrangement SEI messages that contain reserved values of fp\_arrangement\_type.

fp\_quincunx\_sampling\_flag equal to 1 indicates that each colour component plane of each constituent frame is quincunx sampled as illustrated in Figure 10 and fp\_quincunx\_sampling\_flag equal to 0 indicates that the colour component planes of each constituent frame are not quincunx sampled.

When fp\_arrangement\_type is equal to 5, it is a requirement of bitstream conformance that fp\_quincunx\_sampling\_flag shall be equal to 0.

NOTE 5 – For any chroma format (monochrome, 4:2:0, 4:2:2 or 4:4:4), the luma plane and each chroma plane (as applicable) is quincunx sampled as illustrated in Figure 10 when fp\_quincunx\_sampling\_flag is equal to 1.

fp\_content\_interpretation\_type indicates the intended interpretation of the constituent frames as specified in Table 8. Values of fp\_content\_interpretation\_type that do not appear in Table 8 are reserved for future specification by ITU-T | ISO/IEC and shall not be present in bitstreams conforming to this version of this Specification. Decoders shall ignore frame packing arrangement SEI messages that contain reserved values of fp\_content\_interpretation\_type.

For each specified frame packing arrangement scheme, there are two constituent frames that are referred to as frame 0 and frame 1.

**Table 8 – Definition of fp\_content\_interpretation\_type**

Value	Interpretation
0	Unknown or unspecified relationship between the frame packed constituent frames
1	Indicates that the two constituent frames form the left and right views of a stereo view scene, with frame 0 being associated with the left view and frame 1 being associated with the right view
2	Indicates that the two constituent frames form the right and left views of a stereo view scene, with frame 0 being associated with the right view and frame 1 being associated with the left view

NOTE 6 – The value 2 for fp\_content\_interpretation\_type is not expected to be prevalent in industry use of this SEI message. However, the value was specified herein for purposes of completeness.

**fp\_spatial\_flipping\_flag** equal to 1, when `fp_arrangement_type` is equal to 3 or 4, indicates that one of the two constituent frames is spatially flipped relative to its intended orientation for display or other such purposes.

When `fp_arrangement_type` is equal to 3 or 4 and `fp_spatial_flipping_flag` is equal to 1, the type of spatial flipping that is indicated is as follows:

- If `fp_arrangement_type` is equal to 3, the indicated spatial flipping is horizontal flipping.
- Otherwise (`fp_arrangement_type` is equal to 4), the indicated spatial flipping is vertical flipping.

When `fp_arrangement_type` is not equal to 3 or 4, it is a requirement of bitstream conformance that `fp_spatial_flipping_flag` shall be equal to 0. When `fp_arrangement_type` is not equal to 3 or 4, the value 1 for `fp_spatial_flipping_flag` is reserved for future use by ITU-T | ISO/IEC. When `fp_arrangement_type` is not equal to 3 or 4, decoders shall ignore the value 1 for `fp_spatial_flipping_flag`.

**fp\_frame0\_flipped\_flag**, when `fp_spatial_flipping_flag` is equal to 1, indicates which one of the two constituent frames is flipped.

When `fp_spatial_flipping_flag` is equal to 1, `fp_frame0_flipped_flag` equal to 0 indicates that frame 0 is not spatially flipped and frame 1 is spatially flipped and `fp_frame0_flipped_flag` equal to 1 indicates that frame 0 is spatially flipped and frame 1 is not spatially flipped.

When `fp_spatial_flipping_flag` is equal to 0, it is a requirement of bitstream conformance that `fp_frame0_flipped_flag` shall be equal to 0. When `fp_spatial_flipping_flag` is equal to 0, the value 1 for `fp_spatial_flipping_flag` is reserved for future use by ITU-T | ISO/IEC. When `fp_spatial_flipping_flag` is equal to 0, decoders shall ignore the value of `fp_frame0_flipped_flag`.

**fp\_field\_views\_flag** equal to 1 indicates that all pictures in the current CLVS are coded as fields, all fields of a particular parity are considered a first constituent frame and all fields of the opposite parity are considered a second constituent frame. It is a requirement of bitstream conformance that the `fp_field_views_flag` shall be equal to 0, the value 1 for `fp_field_views_flag` is reserved for future use by ITU-T | ISO/IEC and decoders shall ignore the value of `fp_field_views_flag`.

**fp\_current\_frame\_is\_frame0\_flag** equal to 1, when `fp_arrangement` is equal to 5, indicates that the current decoded frame is constituent frame 0 and the next decoded frame in output order is constituent frame 1 and the display time of the constituent frame 0 should be delayed to coincide with the display time of constituent frame 1. `fp_current_frame_is_frame0_flag` equal to 0, when `fp_arrangement` is equal to 5, indicates that the current decoded frame is constituent frame 1 and the previous decoded frame in output order is constituent frame 0 and the display time of the constituent frame 1 should not be delayed for purposes of stereo-view pairing.

When `fp_arrangement_type` is not equal to 5, the constituent frame associated with the upper-left sample of the decoded frame is considered to be constituent frame 0 and the other constituent frame is considered to be constituent frame 1. When `fp_arrangement_type` is not equal to 5, it is a requirement of bitstream conformance that `fp_current_frame_is_frame0_flag` shall be equal to 0. When `fp_arrangement_type` is not equal to 5, the value 1 for `fp_current_frame_is_frame0_flag` is reserved for future use by ITU-T | ISO/IEC. When `fp_arrangement_type` is not equal to 5, decoders shall ignore the value of `fp_current_frame_is_frame0_flag`.

**fp\_frame0\_self\_contained\_flag** equal to 1 indicates that no inter prediction operations within the decoding process for the samples of constituent frame 0 of the CLVS refer to samples of any constituent frame 1. `fp_frame0_self_contained_flag` equal to 0 indicates that some inter prediction operations within the decoding process for the samples of constituent frame 0 of the CLVS might or might not refer to samples of some constituent frame 1. Within a CLVS, the value of `fp_frame0_self_contained_flag` in all frame packing arrangement SEI messages shall be the same.

**fp\_frame1\_self\_contained\_flag** equal to 1 indicates that no inter prediction operations within the decoding process for the samples of constituent frame 1 of the CLVS refer to samples of any constituent frame 0. `fp_frame1_self_contained_flag` equal to 0 indicates that some inter prediction operations within the decoding process for the samples of constituent frame 1 of the CLVS might or might not refer to samples of some constituent frame 0. Within a CLVS, the value of `fp_frame1_self_contained_flag` in all frame packing arrangement SEI messages shall be the same.

When `fp_quincunx_sampling_flag` is equal to 0 and `fp_arrangement_type` is not equal to 5, two ( x, y ) coordinate pairs are specified to determine the indicated luma sampling grid alignment for constituent frame 0 and constituent frame 1, relative to the upper left corner of the rectangular area represented by the samples of the corresponding constituent frame.

NOTE 7 – The location of chroma samples relative to luma samples could be indicated by the `vui_chroma_sample_loc_type_frame` or `vui_chroma_sample_loc_type_top_field` and `vui_chroma_sample_loc_type_bottom_field` syntax elements in the VUI parameters, when present.

**fp\_frame0\_grid\_position\_x** (when present) specifies the x component of the ( x, y ) coordinate pair for constituent frame 0.

**fp\_frame0\_grid\_position\_y** (when present) specifies the y component of the ( x, y ) coordinate pair for constituent frame 0.

**fp\_frame1\_grid\_position\_x** (when present) specifies the x component of the ( x, y ) coordinate pair for constituent frame 1.

**fp\_frame1\_grid\_position\_y** (when present) specifies the y component of the ( x, y ) coordinate pair for constituent frame 1.

When **fp\_quincunx\_sampling\_flag** is equal to 0 and **fp\_arrangement\_type** is not equal to 5 the ( x, y ) coordinate pair for each constituent frame is interpreted as follows:

- If the ( x, y ) coordinate pair for a constituent frame is equal to ( 0, 0 ), this indicates a default sampling grid alignment specified as follows:
  - If **fp\_arrangement\_type** is equal to 3, the indicated position is the same as for the ( x, y ) coordinate pair value ( 4, 8 ), as illustrated in Figure 6.
  - Otherwise (**fp\_arrangement\_type** is equal to 4), the indicated position is the same as for the ( x, y ) coordinate pair value ( 8, 4 ), as illustrated in Figure 8.
- Otherwise, if the ( x, y ) coordinate pair for a constituent frame is equal to ( 15, 15 ), this indicates that the sampling grid alignment is unknown or unspecified or specified by other means not specified in this Specification.
- Otherwise, the x and y elements of the ( x, y ) coordinate pair specify the indicated horizontal and vertical sampling grid alignment positioning to the right of and below the upper left corner of the rectangular area represented by the corresponding constituent frame, respectively, in units of one sixteenth of the luma sample grid spacing between the samples of the columns and rows of the constituent frame that are present in the decoded frame (prior to any upsampling for display or other purposes).

NOTE 8 – The spatial location reference information **fp\_frame0\_grid\_position\_x**, **fp\_frame0\_grid\_position\_y**, **fp\_frame1\_grid\_position\_x**, and **fp\_frame1\_grid\_position\_y** is not provided when **fp\_quincunx\_sampling\_flag** is equal to 1 because the spatial alignment in this case is assumed to be such that constituent frame 0 and constituent frame 1 cover corresponding spatial areas with interleaved quincunx sampling patterns as illustrated in Figure 10.

**fp\_arrangement\_reserved\_byte** is reserved for future use by ITU-T | ISO/IEC. It is a requirement of bitstream conformance that the value of **fp\_arrangement\_reserved\_byte** shall be equal to 0. All other values of **fp\_arrangement\_reserved\_byte** are reserved for future use by ITU-T | ISO/IEC. Decoders shall ignore the value of **fp\_arrangement\_reserved\_byte**.

**fp\_arrangement\_persistence\_flag** specifies the persistence of the frame packing arrangement SEI message for the current layer.

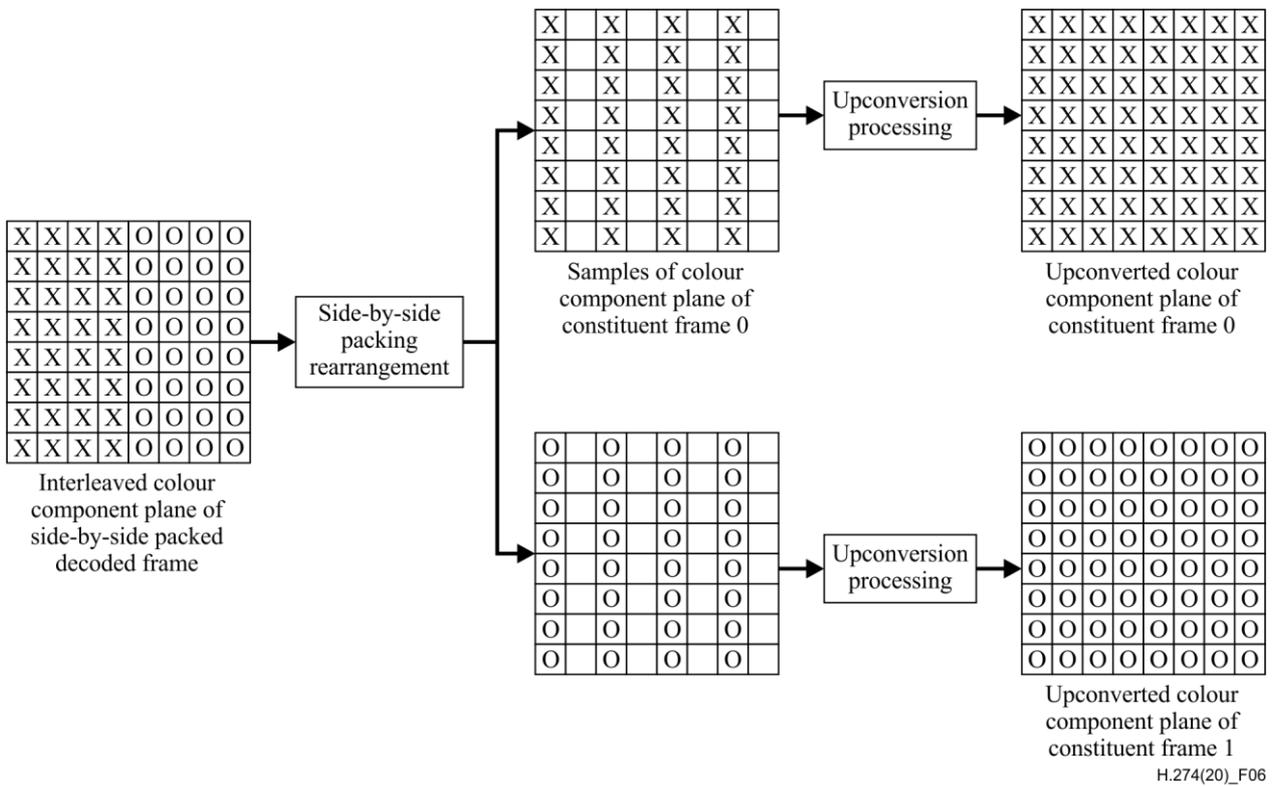

**fp\_arrangement\_persistence\_flag** equal to 0 specifies that the frame packing arrangement SEI message applies to the current decoded frame only.

**fp\_arrangement\_persistence\_flag** equal to 1 specifies that the frame packing arrangement SEI message applies to the current decoded picture and persists all subsequent pictures of the current layer in output order until one or more of the following conditions are true:

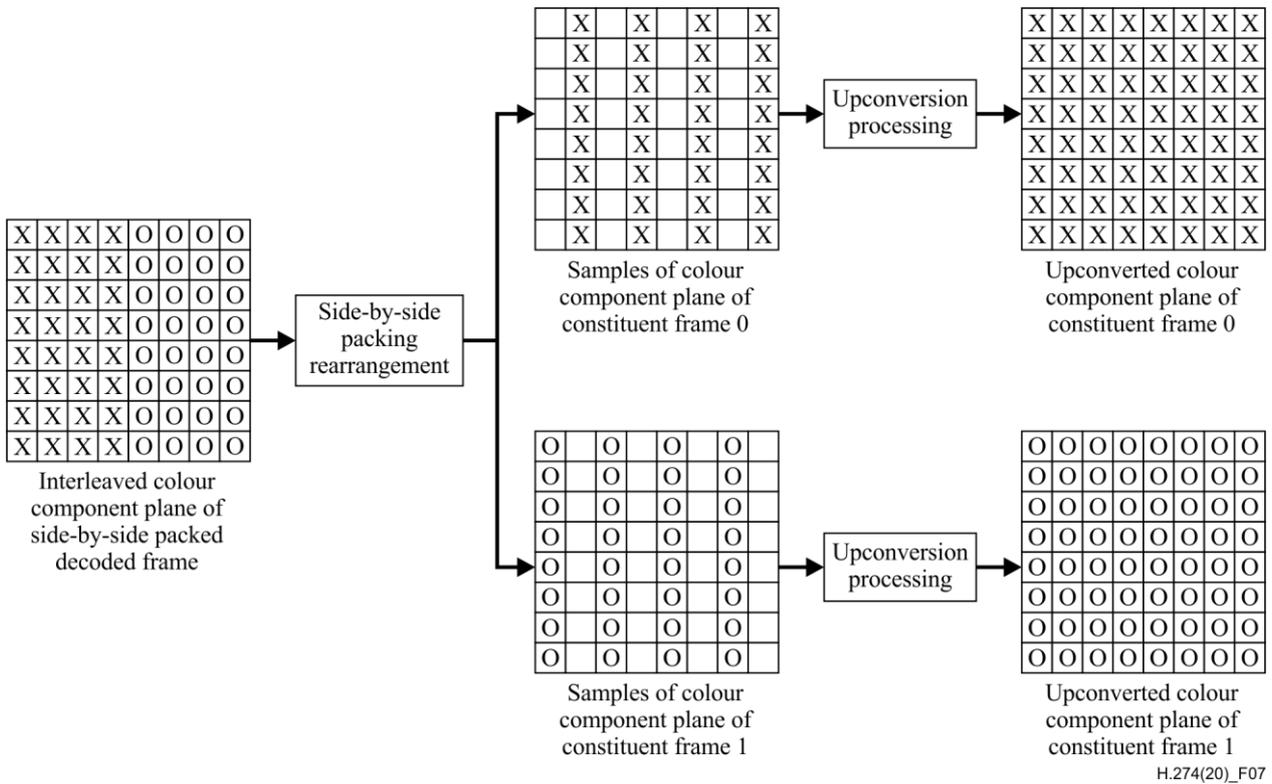

- A new CLVS of the current layer begins.
- The bitstream ends.
- A picture in the current layer in an AU associated with a frame packing arrangement SEI message is output that follows the current picture in output order.

**fp\_upsampled\_aspect\_ratio\_flag** equal to 1 indicates that the SAR indicated by the VUI parameters or the SARI SEI message identifies the SAR of the samples after the application of an upconversion process to produce a higher resolution frame from each constituent frame as illustrated in Figure 6 to Figure 10. **fp\_upsampled\_aspect\_ratio\_flag** equal to 0 indicates that the SAR indicated by the VUI parameters or the SARI SEI message identifies the SAR of the samples before the application of any such upconversion process.

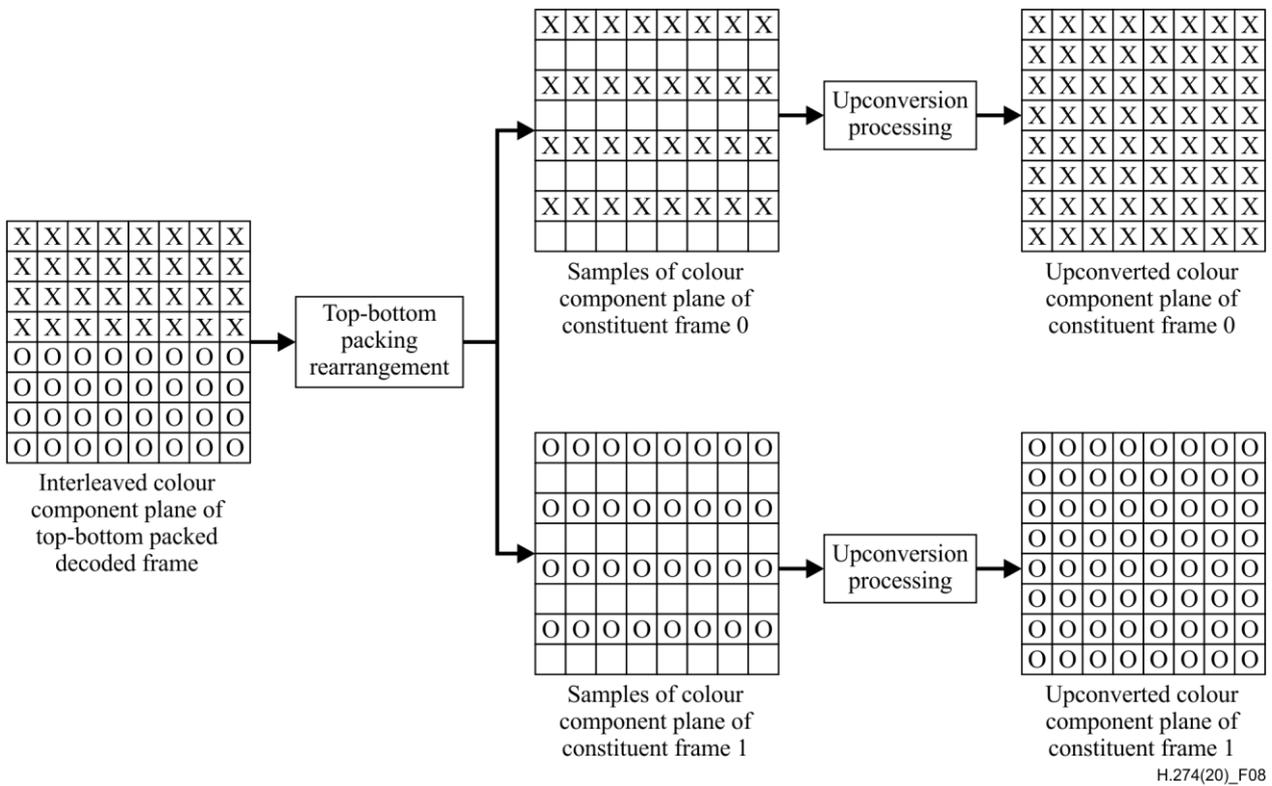

NOTE 9 – The SAR indicated in the VUI parameters or the SARI SEI message could indicate the preferred display picture shape for the packed decoded frame output by a decoder that does not interpret the frame packing arrangement SEI message. When **fp\_upsampled\_aspect\_ratio\_flag** is equal to 1, the SAR produced in each up-converted colour plane is indicated to be the same as the SAR indicated in the VUI parameters or the SARI SEI message in the examples shown in Figure 6 to Figure 10. When **fp\_upsampled\_aspect\_ratio\_flag** is equal to 0, the SAR produced in each colour plane prior to upconversion is indicated to be the same as the SAR indicated in the VUI parameters or the SARI SEI message in the examples shown in Figure 6 to Figure 10.

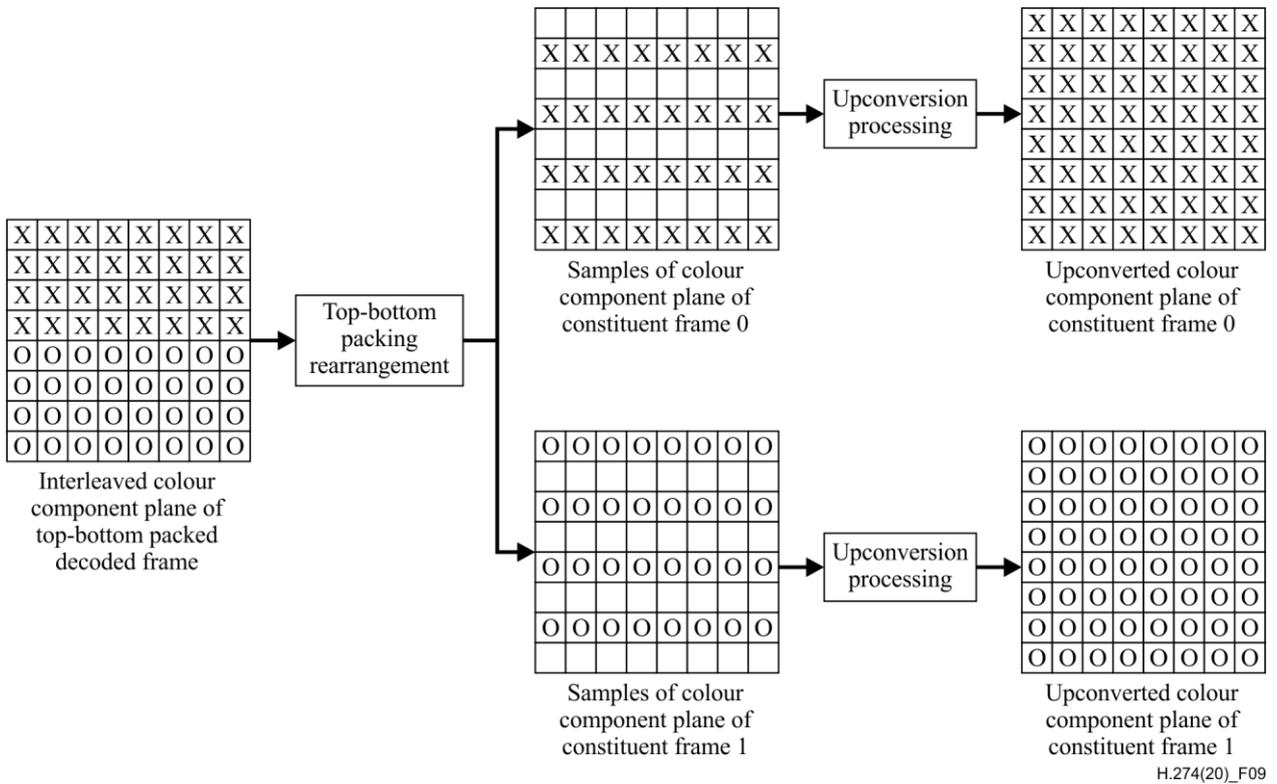

**Figure 6 – Flowchart for rearrangement and upconversion of side-by-side packing arrangement with  $fp\_arrangement\_type$  equal to 3,  $fp\_quincunx\_sampling\_flag$  equal to 0 and  $(x, y)$  equal to  $(0, 0)$  or  $(4, 8)$  for both constituent frames**

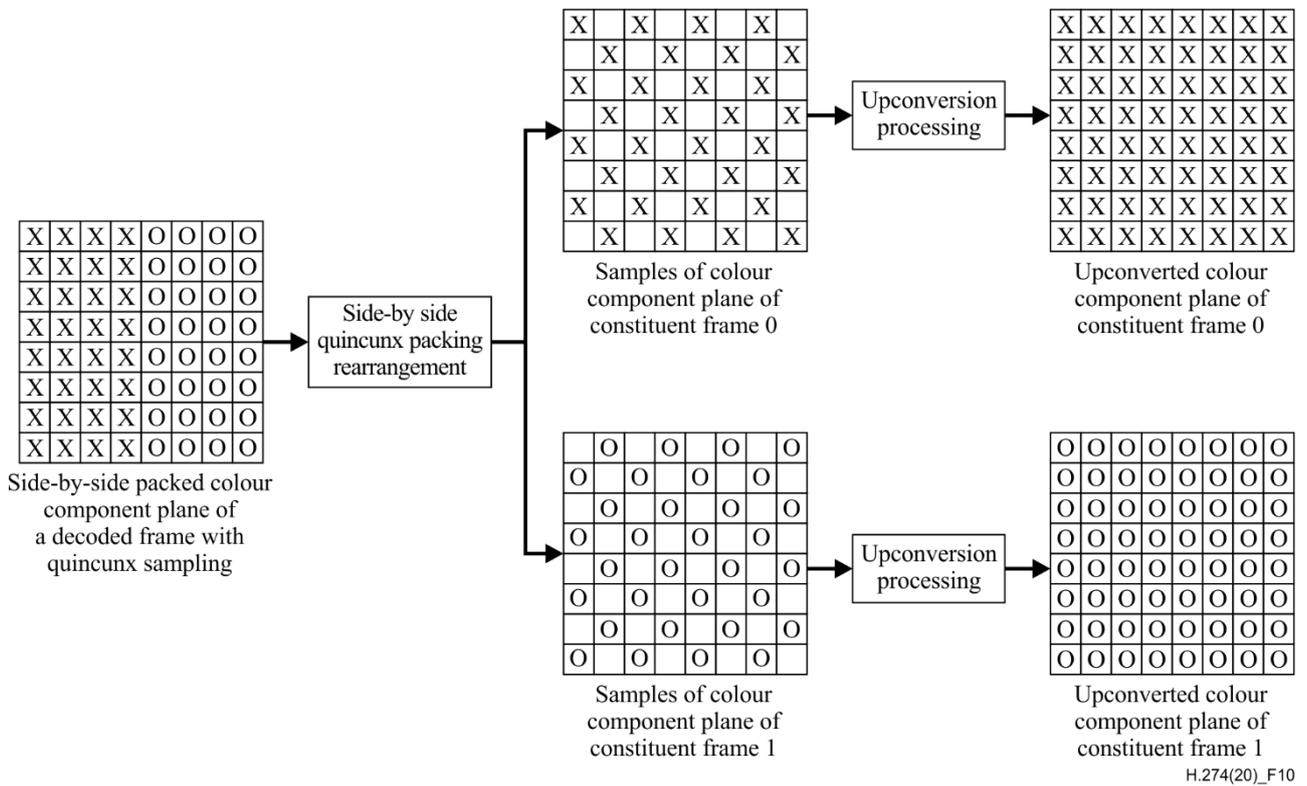

**Figure 7 – Flowchart for rearrangement and upconversion of side-by-side packing arrangement with  $fp\_arrangement\_type$  equal to 3,  $fp\_quincunx\_sampling\_flag$  equal to 0,  $(x, y)$  equal to  $(12, 8)$  for constituent frame 0 and  $(x, y)$  equal to  $(0, 0)$  or  $(4, 8)$  for constituent frame 1**

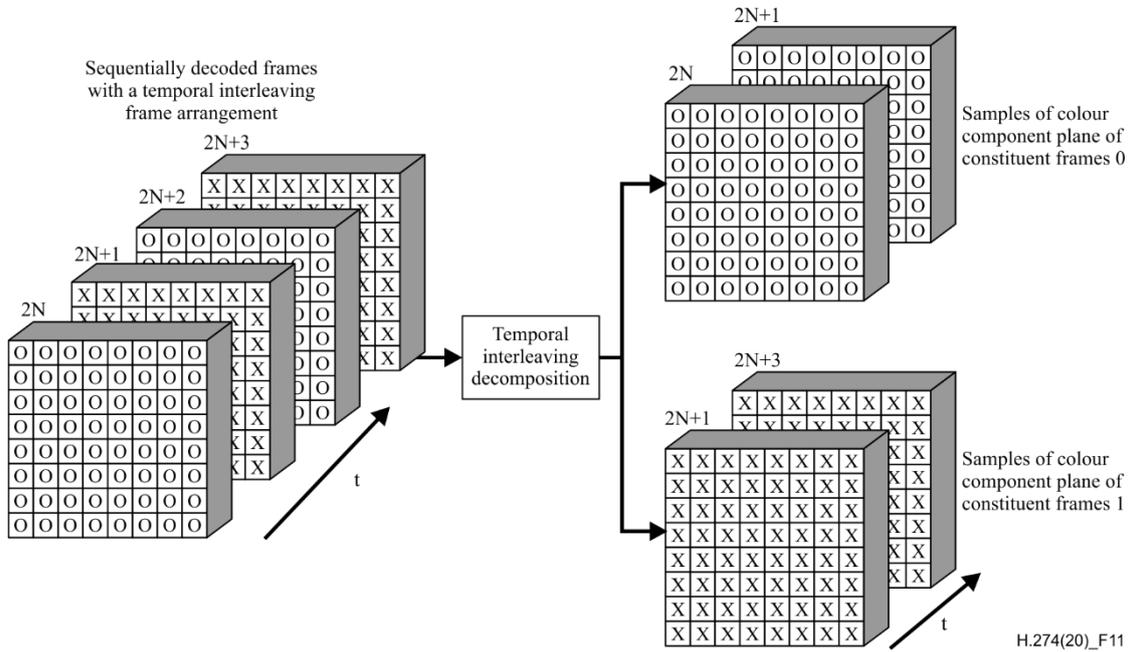

**Figure 8 – Flowchart for rearrangement and upconversion of top-bottom packing arrangement with  $fp\_arrangement\_type$  equal to 4,  $fp\_quincunx\_sampling\_flag$  equal to 0 and  $(x, y)$  equal to  $(0, 0)$  or  $(8, 4)$  for both constituent frames**

**Figure 9 – Flowchart for rearrangement and upconversion of top-bottom packing arrangement with  $fp\_arrangement\_type$  equal to 4,  $fp\_quincunx\_sampling\_flag$  equal to 0,  $(x, y)$  equal to  $(8, 12)$  for constituent frame 0 and  $(x, y)$  equal to  $(0, 0)$  or  $(8, 4)$  for constituent frame 1**

## 8.7 Parameter sets inclusion indication SEI message

### 8.7.1 Parameter sets inclusion indication SEI message syntax

	Descriptor
parameter_sets_inclusion_indication( payloadSize ) {	
psii_self_contained_clvs_flag	u(1)
}	

### 8.7.2 Parameter sets inclusion indication SEI message semantics

This message provides an indication of whether the CLVS contains all the required NAL units for decoding the CLVS that is associated with the SEI message and whether temporal sublayer up-switching within the CLVS works without a need of fetching parameter sets from PUs earlier in decoding order than the PU containing the picture at which the temporal sublayer up-switching occurs. When the CLVS does not contain all the required NAL units, the NAL units that are not present in the CLVS may be provided externally.

**psii\_self\_contained\_clvs\_flag** equal to 1 indicates that the following restrictions apply:

- Each parameter set that is (directly or indirectly) referenced by any VCL NAL unit of the CLVS that is not a VCL NAL unit of a RASL picture (when present) associated with the first AU of the CLVS is present within the CLVS at a position that precedes, in decoding order, any NAL unit that (directly or indirectly) references the parameter set.
- For any STSA picture stsaPicA with temporal sublayer identifier equal to tIdA in the CLVS, the following applies:
  - stsaPicA does not refer to a PPS or an APS that precedes the first NAL unit of the PU containing stsaPicA in decoding order and has temporal sublayer identifier equal to tIdA.
  - For any picture picB with temporal sublayer identifier equal to tIdA and following stsaPicA in decoding order, picB does not refer to a PPS or an APS that has temporal sublayer identifier equal to tIdA that precedes the first NAL unit of the PU containing stsaPicA in decoding order.

**psii\_self\_contained\_clvs\_flag** equal to 0 indicates that this property might or might not apply.

## 8.8 Decoded picture hash SEI message

### 8.8.1 Decoded picture hash SEI message syntax

	Descriptor
decoded_picture_hash( payloadSize ) {	
dph_sei_hash_type	u(8)
dph_sei_single_component_flag	u(1)
dph_sei_reserved_zero_7bits	u(7)
for( cIdx = 0; cIdx < ( dph_sei_single_component_flag ? 1 : 3 ); cIdx++ )	
if( dph_sei_hash_type == 0 )	
for( i = 0; i < 16; i++ )	
dph_sei_picture_md5[ cIdx ][ i ]	b(8)
else if( dph_sei_hash_type == 1 )	
dph_sei_picture_crc[ cIdx ]	u(16)
else if( dph_sei_hash_type == 2 )	
dph_sei_picture_checksum[ cIdx ]	u(32)
}	

### 8.8.2 Decoded picture hash SEI message semantics

This message provides a hash for each colour component of the current decoded picture.

Use of this SEI message requires the definition of the following variables:

- A picture width and picture height in units of luma samples, denoted herein by PicWidthInLumaSamples and PicHeightInLumaSamples, respectively.

- A chroma format indicator, denoted herein by ChromaFormatIdc, as described in clause 7.3.
- A bit depth for the samples of the luma component, denoted herein by BitDepth<sub>Y</sub>, and when ChromaFormatIdc is not equal to 0, a bit depth for the samples of the two associated chroma components, denoted herein by BitDepth<sub>C</sub>.
- For each colour component cIdx, an array of samples ComponentSample[ cIdx ][ x ][ y ].

Prior to computing the hash, the decoded picture data are arranged into one or three strings of bytes called pictureData[ cIdx ] of lengths dataLen[ cIdx ] as follows:

```

for( cIdx = 0; cIdx < dph_sei_single_component_flag ? 1 : 3; cIdx++ ) {
    if( cIdx == 0 ) {
        compWidth[ cIdx ] = PicWidthInLumaSamples
        compHeight[ cIdx ] = PicHeightInLumaSamples
        compDepth[ cIdx ] = BitDepthY
    } else {
        compWidth[ cIdx ] = PicWidthInLumaSamples / SubWidthC
        compHeight[ cIdx ] = PicHeightInLumaSamples / SubHeightC
        compDepth[ cIdx ] = BitDepthC
    }
    iLen = 0
    for( y = 0; y < compHeight[ cIdx ]; y++ ) /* raster scan order */
        for( x = 0; x < compWidth[ cIdx ]; x++ ) {
            pictureData[ cIdx ][ iLen++ ] = ComponentSample[ cIdx ][ x ][ y ] & 0xFF
            if( compDepth[ cIdx ] > 8 )
                pictureData[ cIdx ][ iLen++ ] = ComponentSample[ cIdx ][ x ][ y ] >> 8
        }
    dataLen[ cIdx ] = iLen
}

```

(29)

where ComponentSample[ cIdx ] is a 2-dimension array of the decoded sample values of a component of a decoded picture.

**dph\_sei\_hash\_type** indicates the method used to calculate the checksum as specified in Table 9 . Values of dph\_sei\_hash\_type that are not listed in in Table 9 are reserved for future use by ITU-T | ISO/IEC and shall not be present in payload data conforming to this version of this Specification. Decoders shall ignore decoded picture hash SEI messages that contain reserved values of dph\_sei\_hash\_type.

**Table 9 – Interpretation of dph\_sei\_hash\_type**

dph_sei_hash_type	Method
0	MD5 (IETF RFC 1321)
1	CRC
2	Checksum

**dph\_sei\_single\_component\_flag** equal to 1 specifies that the picture associated with the decoded picture hash SEI message contains a single colour component. dph\_sei\_single\_component\_flag equal to 0 specifies that the picture associated with the decoded picture hash SEI message contains three colour components. The value of dph\_sei\_single\_component\_flag shall be equal to ( ChromaFormatIdc == 0 ).

**dph\_sei\_reserved\_zero\_7bits** shall be equal to 0. Values greater than 0 for dph\_sei\_reserved\_zero\_7bits are reserved for future use by ITU-T | ISO/IEC and shall not be present in payload data conforming to this version of this Specification. Decoders conforming to this version of this Specification shall ignore the value of dph\_sei\_reserved\_zero\_7bits.

**dph\_sei\_picture\_md5**[ cIdx ][ i ] is the 16-byte MD5 hash of the cIdx-th colour component of the decoded picture. The value of dph\_sei\_picture\_md5[ cIdx ][ i ] shall be equal to the value of digestVal[ cIdx ] obtained as follows, using the MD5 functions defined in IETF RFC 1321:

```

MD5Init( context )
MD5Update( context, pictureData[ cIdx ], dataLen[ cIdx ] )
MD5Final( digestVal[ cIdx ], context )

```

(30)

**dph\_sei\_picture\_crc**[ cIdx ] is the cyclic redundancy check (CRC) of the colour component cIdx of the decoded picture. The value of dph\_sei\_picture\_crc[ cIdx ] shall be equal to the value of crcVal[ cIdx ] obtained as follows:

```

crc = 0xFFFF
pictureData[ cIdx ][ dataLen[ cIdx ] ] = 0
pictureData[ cIdx ][ dataLen[ cIdx ] + 1 ] = 0
for( bitIdx = 0; bitIdx < ( dataLen[ cIdx ] + 2 ) * 8; bitIdx++ ) {
    dataByte = pictureData[ cIdx ][ bitIdx >> 3 ]
    crcMsb = ( crc >> 15 ) & 1
    bitVal = ( dataByte >> ( 7 - ( bitIdx & 7 ) ) ) & 1
    crc = ( ( ( crc << 1 ) + bitVal ) & 0xFFFF ) ^ ( crcMsb * 0x1021 )
}
crcVal[ cIdx ] = crc

```

NOTE – The same CRC specification is found in Rec. ITU-T H.271.

**dph\_sei\_picture\_checksum[ cIdx ]** is the checksum of the colour component cIdx of the decoded picture. The value of dph\_sei\_picture\_checksum[ cIdx ] shall be equal to the value of checksumVal[ cIdx ] obtained as follows:

```

sum = 0
for( y = 0; y < compHeight[ cIdx ]; y++ )
    for( x = 0; x < compWidth[ cIdx ]; x++ ) {
        xorMask = ( x & 0xFF ) ^ ( y & 0xFF ) ^ ( x >> 8 ) ^ ( y >> 8 )
        sum = ( sum + ( ( ComponentSample[ cIdx ][ y * compWidth[ cIdx ] + x ] & 0xFF ) ^
            xorMask ) ) & 0xFFFFFFFF
        if( compDepth[ cIdx ] > 8 )
            sum = ( sum + ( ( ComponentSample[ cIdx ][ y * compWidth[ cIdx ] + x ] >> 8 ) ^
                xorMask ) ) & 0xFFFFFFFF
    }
checksumVal[ cIdx ] = sum

```

## 8.9 Mastering display colour volume SEI message

### 8.9.1 Mastering display colour volume SEI message syntax

mastering_display_colour_volume( payloadSize ) {	Descriptor
for( c = 0; c < 3; c++ ) {	
<b>mdev_display primaries_x[ c ]</b>	u(16)
<b>mdev_display primaries_y[ c ]</b>	u(16)
}	
<b>mdev_white_point_x</b>	u(16)
<b>mdev_white_point_y</b>	u(16)
<b>mdev_max_display mastering luminance</b>	u(32)
<b>mdev_min_display mastering luminance</b>	u(32)
}	

### 8.9.2 Mastering display colour volume SEI message semantics

This SEI message identifies the colour volume (the colour primaries, white point, and luminance range) of a display considered to be the mastering display for the associated video content – e.g., the colour volume of a display that was used for viewing while authoring the video content. The described mastering display is a three-colour additive display system that has been configured to use the indicated mastering colour volume.

This SEI message does not identify the measurement methodologies and procedures used for determining the indicated values or provide any description of the mastering environment. It also does not provide information on colour transformations that would be appropriate to preserve creative intent on displays with colour volumes different from that of the described mastering display.

The information conveyed in this SEI message is intended to be adequate for purposes corresponding to the use of SMPTE ST 2086.

When a mastering display colour volume SEI message is present for any picture of a CLVS of a particular layer, a mastering display colour volume SEI message shall be present for the first picture of the CLVS. The mastering display colour volume SEI message persists for the current layer in decoding order from the current picture until the end of the CLVS. All mastering display colour volume SEI messages that apply to the same CLVS shall have the same content.

**mdcv\_display\_primaries\_x[ c ]**, when in the range of 5 to 37 000, inclusive, specifies the normalized x chromaticity coordinate of the colour primary component c of the mastering display, according to the CIE 1931 definition of x as specified in ISO 11664-1 (see also ISO 11664-3 and CIE 15), in increments of 0.00002. When **mdcv\_display\_primaries\_x[ c ]** is not in the range of 5 to 37 000, inclusive, the normalized x chromaticity coordinate of the colour primary component c of the mastering display is unknown or unspecified or specified by other means not specified in this Specification.

**mdcv\_display\_primaries\_y[ c ]**, when in the range of 5 to 42 000, inclusive, specifies the normalized y chromaticity coordinate of the colour primary component c of the mastering display, according to the CIE 1931 definition of y as specified in ISO 11664-1 (see also ISO 11664-3 and CIE 15), in increments of 0.00002. When **mdcv\_display\_primaries\_y[ c ]** is not in the range of 5 to 42 000, inclusive, the normalized y chromaticity coordinate of the colour primary component c of the mastering display is unknown or unspecified or specified by other means not specified in this Specification.

For describing mastering displays that use red, green, and blue colour primaries, it is suggested that index value c equal to 0 should correspond to the green primary, c equal to 1 should correspond to the blue primary, and c equal to 2 should correspond to the red colour primary specified in the VUI parameters.

**mdcv\_white\_point\_x**, when in the range of 5 to 37 000, inclusive, specifies the normalized x chromaticity coordinate of the white point of the mastering display, according to the CIE 1931 definition of x as specified in ISO 11664-1 (see also ISO 11664-3 and CIE 15), in normalized increments of 0.00002. When **mdcv\_white\_point\_x** is not in the range of 5 to 37 000, inclusive, the normalized x chromaticity coordinate of the white point of the mastering display is indicated to be unknown or unspecified or specified by other means not specified in this Specification.

**mdcv\_white\_point\_y**, when in the range of 5 to 42 000, inclusive, specifies the normalized y chromaticity coordinate of the white point of the mastering display, according to the CIE 1931 definition of y as specified in ISO 11664-1 (see also ISO 11664-3 and CIE 15), in normalized increments of 0.00002. When **mdcv\_white\_point\_y** is not in the range of 5 to 42 000, inclusive, the normalized y chromaticity coordinate of the white point of the mastering display is indicated to be unknown or unspecified or specified by other means not specified in this Specification.

NOTE 1 – SMPTE ST 2086 specifies that the normalized x and y chromaticity coordinate values for the mastering display colour primaries and white point are to be represented with four decimal places. This would correspond with using values of the syntax elements **mdcv\_display\_primaries\_x[ c ]**, **mdcv\_display\_primaries\_y[ c ]**, **mdcv\_white\_point\_x**, and **mdcv\_white\_point\_y**, as defined in this Specification, that are multiples of 5.

NOTE 2 – An example of the use of values outside the range for which semantics are specified in this Specification is that ANSI/CTA 861-G uses normalized (x, y) chromaticity coordinate values of (0,0) for the white point to indicate that the white point chromaticity is unknown.

**mdcv\_max\_display\_mastering\_luminance**, when in the range of 50 000 to 100 000 000, specifies the nominal maximum display luminance of the mastering display in units of 0.0001 candelas per square metre. When **mdcv\_max\_display\_mastering\_luminance** is not in the range of 50 000 to 100 000 000, the nominal maximum display luminance of the mastering display is indicated to be unknown or unspecified or specified by other means not specified in this Specification.

NOTE 3 – SMPTE ST 2086 specifies that the nominal maximum display luminance of the mastering display is to be specified as a multiple of 1 candela per square metre. This would correspond with using values of the syntax element **mdcv\_max\_display\_mastering\_luminance**, as defined in this Specification, that are a multiple of 10 000.

NOTE 4 – An example of the use of values outside the range for which semantics are specified in this Specification is that ANSI/CTA 861-G uses the value 0 for the nominal maximum display luminance of the mastering display to indicate that the nominal maximum display luminance of the mastering display is unknown.

**mdcv\_min\_display\_mastering\_luminance**, when in the range of 1 to 50 000, specifies the nominal minimum display luminance of the mastering display in units of 0.0001 candelas per square metre. When **mdcv\_min\_display\_mastering\_luminance** is not in the range of 1 to 50 000, the nominal maximum display luminance of the mastering display is unknown or unspecified or specified by other means not specified in this Specification. When **mdcv\_max\_display\_mastering\_luminance** is equal to 50 000, **mdcv\_min\_display\_mastering\_luminance** shall not be equal to 50 000.

NOTE 5 – SMPTE ST 2086 specifies that the nominal minimum display luminance of the mastering display is to be specified as a multiple of 0.0001 candelas per square metre, which corresponds to the semantics specified in this Specification.

NOTE 6 – An example of the use of values outside the range for which semantics are specified in this Specification is that ANSI/CTA 861-G uses the value 0 for the nominal minimum display luminance of the mastering display to indicate that the nominal minimum display luminance of the mastering display is unknown.

NOTE 7 – Another example of the potential use of values outside the range for which semantics are specified in this Specification is that SMPTE ST 2086 indicates that values outside the specified range could be used to indicate that the black level and contrast of the mastering display have been adjusted using picture line-up generation equipment (PLUGE).

At the minimum luminance, the mastering display is considered to have the same nominal chromaticity as the white point.

## 8.10 Content light level information SEI message

### 8.10.1 Content light level information SEI message syntax

content_light_level_info( payloadSize ) {	<b>Descriptor</b>
<b>cli_max_content_light_level</b>	u(16)
<b>cli_max_pic_average_light_level</b>	u(16)
}	

### 8.10.2 SMPTE light level information SEI message semantics

This SEI message identifies upper bounds for the nominal target brightness light level of the pictures of the CLVS.

The information conveyed in this SEI message is intended to be adequate for purposes corresponding to the use of the Consumer Electronics Association 861.3 specification.

The semantics of the content light level information SEI message are defined in relation to the values of samples in a 4:4:4 representation of red, green, and blue colour primary intensities in the linear light domain for the pictures of the CLVS, in units of candelas per square metre. However, this SEI message does not, by itself, identify a conversion process for converting the sample values of a decoded picture to the samples in a 4:4:4 representation of red, green, and blue colour primary intensities in the linear light domain for the picture.

NOTE 1 – Other syntax elements, such as `vui_colour primaries`, `vui_transfer_characteristics`, and `vui_matrix_coeffs`, when present, could assist in the identification of such a conversion process.

Given the red, green, and blue colour primary intensities in the linear light domain for the location of a luma sample in a corresponding 4:4:4 representation, denoted as  $E_R$ ,  $E_G$ , and  $E_B$ , the maximum component intensity is defined as  $E_{Max} = \text{Max}( E_R, \text{Max}( E_G, E_B ) )$ . The light level corresponding to the stimulus is then defined as the CIE 1931 luminance corresponding to equal amplitudes of  $E_{Max}$  for all three colour primary intensities for red, green, and blue (with appropriate scaling to reflect the nominal luminance level associated with peak white – e.g., ordinarily scaling to associate peak white with 10 000 candelas per square metre when `vui_transfer_characteristics` is equal to 16).

NOTE 2 – Since the maximum value  $E_{Max}$  is used in this definition at each sample location, rather than a direct conversion from  $E_R$ ,  $E_G$ , and  $E_B$  to the corresponding CIE 1931 luminance, the CIE 1931 luminance at a location could in some cases be less than the indicated light level. This situation would occur, for example, when  $E_R$  and  $E_G$  are very small and  $E_B$  is large, in which case the indicated light level would be much larger than the true CIE 1931 luminance associated with the  $( E_R, E_G, E_B )$  triplet.

All content light level information SEI messages that apply to the same CLVS shall have the same content.

**cli\_max\_content\_light\_level**, when not equal to 0, indicates an upper bound on the maximum light level among all individual samples in a 4:4:4 representation of red, green, and blue colour primary intensities (in the linear light domain) for the pictures of the CLVS, in units of candelas per square metre. When equal to 0, no such upper bound is indicated by `cli_max_content_light_level`.

**cli\_max\_pic\_average\_light\_level**, when not equal to 0, indicates an upper bound on the maximum average light level among the samples in a 4:4:4 representation of red, green, and blue colour primary intensities (in the linear light domain) for any individual picture of the CLVS, in units of candelas per square metre. When equal to 0, no such upper bound is indicated by `cli_max_pic_average_light_level`.

When the visually relevant region does not correspond to the entire cropped decoded picture, such as for "letterbox" encoding of video content with a wide picture aspect ratio within a taller cropped decoded picture, the indicated average should be performed only within the visually relevant region.

## 8.11 Dependent random access point indication SEI message

### 8.11.1 Dependent random access point indication SEI message syntax

dependent_rap_indication( payloadSize ) {	<b>Descriptor</b>
}	

### 8.11.2 Dependent random access point indication SEI message semantics

The picture associated with a dependent random access point (DRAP) indication SEI message is referred to as a DRAP picture.

The presence of the DRAP indication SEI message indicates that the constraints on picture order and picture referencing specified in this clause apply. These constraints can enable a decoder to properly decode the DRAP picture and the pictures that follow it in both decoding order and output order without needing to decode any other pictures except the associated IRAP picture of the DRAP picture.

The constraints indicated by the presence of the DRAP indication SEI message, which shall all apply, are as follows:

- The DRAP picture is a trailing picture.
- The DRAP picture has a temporal sublayer identifier equal to 0.
- The DRAP picture does not include any pictures in the active entries of its reference picture lists except the associated IRAP picture of the DRAP picture.
- Any picture that follows the DRAP picture in both decoding order and output order does not include, in the active entries of its reference picture lists, any picture that precedes the DRAP picture in decoding order or output order, with the exception of the associated IRAP picture of the DRAP picture.

## 8.12 Alternative transfer characteristics information SEI message

### 8.12.1 Alternative transfer characteristics information SEI message syntax

alternative_transfer_characteristics ( payloadSize ) {	<b>Descriptor</b>
<b>preferred_transfer_characteristics</b>	u(8)
}	

### 8.12.2 Alternative transfer characteristics SEI message semantics

The alternative transfer characteristics SEI message provides a preferred alternative value for the transfer\_characteristics syntax element that is indicated by the colour description syntax of the VUI parameters. This SEI message is intended to be used in cases when some value of vui\_transfer\_characteristics is preferred for interpretation of the pictures of the CLVS although some other value of vui\_transfer\_characteristics could also be acceptable for interpretation of the pictures of the CLVS and that other value is provided in the colour description syntax of the VUI parameters for interpretation by decoders that do not support interpretation of the preferred value (e.g., because the preferred value had not yet been defined in a previous version of this Specification).

When an alternative transfer characteristics SEI message is present for any picture of a CLVS of a particular layer and the first picture of the CLVS is an IRAP picture, an alternative transfer characteristics SEI message shall be present for that IRAP picture. The alternative transfer characteristics SEI message persists for the current layer in decoding order from the current picture until the end of the CLVS. All alternative transfer characteristics SEI messages that apply to the same CLVS shall have the same content.

**preferred\_transfer\_characteristics** specifies a preferred alternative value for the vui\_transfer\_characteristics syntax element of the colour description syntax of the VUI parameters. The semantics for preferred\_transfer\_characteristics are otherwise the same as for the vui\_transfer\_characteristics syntax element specified in the VUI parameters. When preferred\_transfer\_characteristics is not equal to the value of vui\_transfer\_characteristics indicated in the VUI parameters, decoders should ignore the value of vui\_transfer\_characteristics indicated in the VUI parameters and instead use the value indicated by preferred\_transfer\_characteristics.

## 8.13 Ambient viewing environment SEI message

### 8.13.1 Ambient viewing environment SEI message syntax

	Descriptor
ambient_viewing_environment( payloadSize ) {	
<b>ambient_illuminance</b>	u(32)
<b>ambient_light_x</b>	u(16)
<b>ambient_light_y</b>	u(16)
}	

### 8.13.2 Ambient viewing environment SEI message semantics

The ambient viewing environment SEI message identifies the characteristics of the nominal ambient viewing environment for the display of the associated video content. The syntax elements of the ambient viewing environment SEI message can assist the receiving system in adapting the received video content for local display in viewing environments that could be similar or could substantially differ from those assumed or intended when mastering the video content.

This SEI message does not provide information on colour transformations that would be appropriate to preserve creative intent on displays with colour volumes different from that of the described mastering display.

When an ambient viewing environment SEI message is present for any picture of a CLVS of a particular layer and the first picture of the CLVS is an IRAP picture, an ambient viewing environment SEI message shall be present for that IRAP picture. The ambient viewing environment SEI message persists for the current layer in decoding order from the current picture until the end of the CLVS. All ambient viewing environment SEI messages that apply to the same CLVS shall have the same content.

**ambient\_illuminance** specifies the environmental illuminance of the ambient viewing environment in units of 0.0001 lux. **ambient\_illuminance** shall not be equal to 0.

**ambient\_light\_x** and **ambient\_light\_y** specify the normalized x and y chromaticity coordinates, respectively, of the environmental ambient light in the nominal viewing environment, according to the CIE 1931 definition of x and y as specified in ISO 11664-1 (see also ISO 11664-3 and CIE 15), in normalized increments of 0.00002. The values of **ambient\_light\_x** and **ambient\_light\_y** shall be in the range of 0 to 50 000.

NOTE – For example, the conditions identified in Rec. ITU-R BT.2035 could be expressed using **ambient\_illuminance** equal to 100 000 with background chromaticity indicating D<sub>65</sub> (**ambient\_light\_x** equal to 15 635, **ambient\_light\_y** equal to 16 450), or optionally in some regions, background chromaticity indicating D<sub>93</sub> (**ambient\_light\_x** equal to 14 155, **ambient\_light\_y** equal to 14 855).

## 8.14 Content colour volume SEI message

### 8.14.1 Content colour volume SEI message syntax

	Descriptor
content_colour_volume( payloadSize ) {	
<b>ccv_cancel_flag</b>	u(1)
if( !ccv_cancel_flag ) {	
<b>ccv_persistence_flag</b>	u(1)

}	
}	

if( ccv_min_luminance_value_present_flag )	
<b>ccv_min_luminance_value</b>	u(32)
if( ccv_max_luminance_value_present_flag )	
<b>ccv_max_luminance_value</b>	u(32)
if( ccv_avg_luminance_value_present_flag )	
<b>ccv_avg_luminance_value</b>	u(32)
}	
}	

### 8.14.2 Content colour volume SEI message semantics

The content colour volume SEI message describes the colour volume characteristics of the associated pictures. These colour volume characteristics are expressed in terms of a nominal range, although deviations from this range may occur.

The variable transferCharacteristics is specified as follows:

- If an alternative transfer characteristics SEI message is present for the CLVS, transferCharacteristics is set equal to preferred\_transfer\_characteristics;
- Otherwise, (an alternative transfer characteristics SEI message is not present for the CLVS), transferCharacteristics is set equal to vui\_transfer\_characteristics.

The content colour volume SEI message shall not be present, and decoders shall ignore it, when any of the following conditions is true:

- Any of the values of transferCharacteristics, vui\_colour primaries, and vui\_matrix\_coeffs has a value defined as unknown or unspecified.
- The value of vui\_transfer\_characteristics is equal to 2, 4, or 5.
- The value of vui\_colour primaries is equal to 2.

The following applies when converting the signal from a non-linear to a linear representation:

- If the value of transferCharacteristics is equal to 1, 6, 7, 14, or 15, the Rec. ITU-R BT.1886 reference electro-optical transfer function should be used to convert the signal to its linear representation, where the value of screen luminance for white is set equal to 100 candelas per square metre, the value of screen luminance for black is set equal to 0 candelas per square metre, and the value of the exponent of the power function is set equal to 2.4.
- Otherwise, if the value of transferCharacteristics is equal to 18, the hybrid log-gamma reference electro-optical transfer function specified in Rec. ITU-R BT.2100 should be used to convert the signal to its linear representation, where the value of nominal peak luminance of the display is set equal to 1000 candelas per square metre, the value of the display luminance for black is set equal to 0 candelas per square metre, and the value of system gamma is set equal to 1.2.
- Otherwise (the value of transferCharacteristics is not equal to 1, 6, 7, 14, 15, or 18) when the content colour volume SEI message is present, the exact inverse of the transfer function specified in specified in the VUI parameters should be used to convert the non-linear signal to a linear representation.

**ccv\_cancel\_flag** equal to 1 indicates that the content colour volume SEI message cancels the persistence of any previous content colour volume SEI message in output order that applies to the current layer. ccv\_cancel\_flag equal to 0 indicates that content colour volume information follows.

**ccv\_persistence\_flag** specifies the persistence of the content colour volume SEI message for the current layer.

ccv\_persistence\_flag equal to 0 specifies that the content colour volume applies to the current decoded picture only.

ccv\_persistence\_flag equal to 1 specifies that the content colour volume SEI message applies to the current decoded picture and persists for all subsequent pictures of the current layer in output order until one or more of the following conditions are true:

- A new CLVS of the current layer begins.
- The bitstream ends.
- A picture in the current layer in an AU associated with a content colour volume SEI message is output that follows the current picture in output order.

**ccv primaries\_present\_flag** equal to 1 specifies that the syntax elements `ccv_primaries_x[ c ]` and `ccv_primaries_y[ c ]` are present. `ccv_primaries_present_flag` equal to 0 specifies that the syntax elements `ccv_primaries_x[ c ]` and `ccv_primaries_y[ c ]` are not present.

**ccv\_min\_luminance\_value\_present\_flag** equal to 1 specifies that the syntax element `ccv_min_luminance_value` is present. `ccv_min_luminance_value_present_flag` equal to 0 specifies that the syntax element `ccv_min_luminance_value` is not present.

**ccv\_max\_luminance\_value\_present\_flag** equal to 1 specifies that the syntax element `ccv_max_luminance_value` is present. `ccv_max_luminance_value_present_flag` equal to 0 specifies that the syntax element `ccv_max_luminance_value` is not present.

**ccv\_avg\_luminance\_value\_present\_flag** equal to 1 specifies that the syntax element `ccv_avg_luminance_value` is present. `ccv_avg_luminance_value_present_flag` equal to 0 specifies that the syntax element `ccv_avg_luminance_value` is not present.

It is a requirement of bitstream conformance that the values of `ccv_primaries_present_flag`, `ccv_min_luminance_value_present_flag`, `ccv_max_luminance_value_present_flag`, and `ccv_avg_luminance_value_present_flag` shall not all be equal to 0.

**ccv\_reserved\_zero\_2bits[ i ]** shall be equal to 0 in bitstreams conforming to this version of this Specification. Other values for `reserved_zero_2bits[ i ]` are reserved for future use by ITU-T | ISO/IEC. Decoders shall ignore the value of `reserved_zero_2bits[ i ]`.

**ccv\_primaries\_x[ c ]** and **ccv\_primaries\_y[ c ]** specify the normalized x and y chromaticity coordinates, respectively, of the colour primary component c of the nominal content colour volume, according to the CIE 1931 definition of x and y as specified in ISO 11664-1 (see also ISO 11664-3 and CIE 15), in normalized increments of 0.00002. For describing colour volumes that use red, green, and blue colour primaries, it is suggested that index value c equal to 0 should correspond to the green primary, c equal to 1 should correspond to the blue primary, and c equal to 2 should correspond to the red colour primary specified in the VUI parameters.

The values of `ccv_primaries_x[ c ]` and `ccv_primaries_y[ c ]` shall be in the range of  $-5\,000\,000$  to  $5\,000\,000$ , inclusive.

When `ccv_primaries_x[ c ]` and `ccv_primaries_y[ c ]` are not present, they are inferred to be equal to the normalized x and y chromaticity coordinates, respectively, specified by `vui_colour_primaries`.

**ccv\_min\_luminance\_value** specifies the normalized minimum luminance value, according to CIE 1931, that is expected to be present in the content, where values are normalized to  $L_0$  or  $L_c$  as specified in the VUI parameters according to the indicated transfer characteristics of the signal. The values of `ccv_min_luminance_value` are in normalized increments of 0.0000001.

**ccv\_max\_luminance\_value** specifies the maximum luminance value, according to CIE 1931, that is expected to be present in the content, where values are normalized to  $L_0$  or  $L_c$  as specified in the VUI parameters according to the transfer characteristics of the signal. The values of `ccv_max_luminance_value` are in normalized increments of 0.0000001.

**ccv\_avg\_luminance\_value** specifies the average luminance value, according to CIE 1931, that is expected to be present in the content, where values are normalized to  $L_0$  or  $L_c$  as specified in the VUI parameters according to the transfer characteristics of the signal. The values of `ccv_avg_luminance_value` are in normalized increments of 0.0000001.

NOTE – The resulting domain from this conversion process might or might not represent light in a source or display domain – it is merely a gamut representation domain rather than necessarily being a representation of actual light in either the scene or display domain. Therefore, the values corresponding to `ccv_min_luminance_value`, `ccv_max_luminance_value`, and `ccv_avg_luminance_value` might not necessarily correspond to a true luminance value.

The value of `ccv_min_luminance_value`, when present, shall be less than or equal to `ccv_avg_luminance_value`, when present. The value of `ccv_avg_luminance_value`, when present, shall be less than or equal to `ccv_max_luminance_value`, when present. The value of `ccv_min_luminance_value`, when present, shall be less than or equal to `ccv_max_luminance_value`, when present.

When the visually relevant region does not correspond to the entire cropped decoded picture, such as for "letterbox" encoding of video content with a wide picture aspect ratio within a taller cropped decoded picture, the indicated `ccv_min_luminance_value`, `ccv_max_luminance_value`, and `ccv_avg_luminance_value` should correspond only to values within the visually relevant region.

## 8.15 Omnidirectional video specific SEI messages

### 8.15.1 Sample location remapping process

#### 8.15.1.1 General

Use of this process requires the definition of the following variable:

- A chroma format indicator, denoted herein by `ChromaFormatIdc`, as described in clause 7.3.

To remap colour sample locations of a region-wise packed picture to a unit sphere, the following ordered steps are applied:

1. A region-wise packed picture is obtained as the cropped decoded picture by decoding a coded picture. For purposes of interpretation of chroma samples, the input to the indicated remapping process is the set of decoded sample values after applying an (unspecified) upsampling conversion process to the 4:4:4 colour sampling format as necessary when `ChromaFormatIdc` is equal to 1 (4:2:0 chroma format) or 2 (4:2:2 chroma format). This (unspecified) upsampling process should account for the relative positioning relationship between the luma and chroma samples as indicated by `vui_chroma_sample_loc_type_frame`, `vui_chroma_sample_loc_type_top_field`, and `vui_chroma_sample_loc_type_bottom_field` syntax elements in the VUI parameters, when present.
2. If RWP is indicated, the sample locations of the region-wise packed picture are converted to sample locations of the respective projected picture as specified in clause 8.15.1.4. Otherwise, the projected picture is identical to the region-wise packed picture.
3. If frame packing is indicated, the sample locations of the projected picture are converted to sample locations of the respective constituent picture of the projected picture, as specified in clause 8.15.1.5. Otherwise, the constituent picture of the projected picture is identical to the projected picture.
4. The sample locations of a constituent picture of the projected picture are converted to sphere coordinates relative to the local coordinate axes, as specified in clause 8.15.1.2.
5. If rotation is indicated, the sphere coordinates relative to the local coordinate axes are converted to sphere coordinates relative to the global coordinate axes, as specified in clause 8.15.1.3. Otherwise, the global coordinate axes are identical to the local coordinate axes.

The overall process for mapping of luma sample locations within a region-wise packed picture to sphere coordinates relative to the global coordinate axes is normatively specified in clause 8.15.1.5.

For each region-wise packed picture corresponding to a decoded picture, the following applies:

- When an equirectangular projection SEI message with `erp_cancel_flag` equal to 0 that applies to the picture is present, `ErpFlag` is set equal to 1, and `CmpFlag` is set equal to 0.
- When a generalized cubemap projection SEI message with `gcmp_cancel_flag` equal to 0 that applies to the picture is present, `CmpFlag` is set equal to 1, and `ErpFlag` is set equal to 0.
- If a sphere rotation SEI message with `sphere_rotation_cancel_flag` equal to 0 that applies to the picture is present, `RotationFlag` is set equal to 1, and `RotationYaw`, `RotationPitch`, and `RotationRoll` are set equal to  $\text{yaw\_rotation} \div 2^{16}$ ,  $\text{pitch\_rotation} \div 2^{16}$ , and  $\text{roll\_rotation} \div 2^{16}$ , respectively.
- Otherwise, `RotationFlag` is set equal to 0.
- If a frame packing arrangement SEI message with `fp_arrangement_cancel_flag` equal to 0 that applies to the picture is not present, `StereoFlag`, `TopBottomFlag`, and `SideBySideFlag` are all set equal to 0, `HorDiv1` is set equal to 1, and `VerDiv1` is set equal to 1.
- Otherwise, the following applies:
  - `StereoFlag` is set equal to 1.
  - If the value of `fp_arrangement_type` of the frame packing arrangement SEI message is equal to 3, `TopBottomFlag` is set equal to 0, `SideBySideFlag` is set equal to 1, `HorDiv1` is set equal to 2 and `VerDiv1` is set equal to 1.
  - Otherwise, if the value of `fp_arrangement_type` of the frame packing arrangement SEI message is equal to 4, `TopBottomFlag` is set equal to 1, `SideBySideFlag` is set equal to 0, `HorDiv1` is set equal to 1, and `VerDiv1` is set equal to 2.
  - Otherwise, `TopBottomFlag` is set equal to 0, `SideBySideFlag` is set equal to 0, `HorDiv1` is set equal to 1, and `VerDiv1` is set equal to 1.
- If a RWP SEI message with `rwp_cancel_flag` equal to 0 that applies to the picture is not present, `RegionWisePackingFlag` is set equal to 0, and `ConstituentPicWidth` and `ConstituentPicHeight` are set to be equal to

cropPicWidth / HorDiv1 and cropPicHeight / VerDiv1, respectively, where cropPicWidth and cropPicHeight are the width and height, respectively, of the cropped decoded picture.

- Otherwise, RegionWisePackingFlag is set equal to 1, and ConstituentPicWidth and ConstituentPicHeight are set equal to rwp\_proj\_picture\_width / HorDiv1 and rwp\_proj\_picture\_height / VerDiv1, respectively.

### 8.15.1.2 Projection for one sample location

Inputs to this process are:

- pictureWidth and pictureHeight, which are the width and height, respectively, of a monoscopic projected luma picture, in relative projected picture sample units (see clause 8.15.5.2), and
- the centre point of a sample location (hPos, vPos) along the horizontal and vertical axes, respectively, in relative projected picture sample units, where hPos and vPos could have non-integer real values.

Outputs of this process are:

- sphere coordinates ( $\phi$ ,  $\theta$ ) for the sample location in degrees relative to the local coordinate axes.

The projection for a sample location is derived as follows:

- If ErpFlag is equal to 1, the following applies:

- If RegionWisePackingFlag is equal to 0 and erp\_guard\_band\_flag is equal to 1, the following applies:

$$\begin{aligned} \text{hPos}' &= \text{hPos} - \text{erp\_left\_guard\_band\_width} \\ \text{pictureWidth} &= \text{pictureWidth} - \text{erp\_left\_guard\_band\_width} - \text{erp\_right\_guard\_band\_width} \end{aligned} \quad (33)$$

- Otherwise, the following applies:

$$\text{hPos}' = \text{hPos} \quad (34)$$

- The following applies:

$$\begin{aligned} \phi &= 180 - \text{hPos}' * (360 \div \text{pictureWidth}) \\ \theta &= 90 - \text{vPos} * (180 \div \text{pictureHeight}) \end{aligned} \quad (35)$$

- Otherwise (CmpFlag is equal to 1), the outputs are derived by the following ordered steps:

1. Clause 8.15.1.7 is invoked with pictureWidth and pictureHeight as inputs, and the output is assigned to faceWidth and faceHeight.
2. Clause 8.15.1.8 is invoked with hPos, vPos, faceWidth, and faceHeight, where hPos and vPos are within a projected picture, and the output is assigned to hPosFace and vPosFace within a projected face.
3. Clause 8.15.1.9 is invoked with hPosFace, vPosFace, faceWidth, and faceHeight, and the output is assigned to hPosRot and vPosRot.
4. If gcmp\_packing\_type is equal to 4 or 5, clause 8.15.1.10 is invoked with hPosRot, vPosRot, faceWidth, and faceHeight, and the output is assigned to hPosAdj and vPosAdj. Otherwise, hPosAdj and vPosAdj are identical to hPosRot and vPosRot, respectively.
5. The following applies:

$$\begin{aligned} \text{hPos}' &= - (2 * \text{hPosAdj} \div \text{faceWidth}) + 1 \\ \text{vPos}' &= - (2 * \text{vPosAdj} \div \text{faceHeight}) + 1 \end{aligned} \quad (36)$$

- If gcmp\_mapping\_function\_type is equal to 0, the following applies:

$$\begin{aligned} \text{hPos}'' &= \text{hPos}' \\ \text{vPos}'' &= \text{vPos}' \end{aligned} \quad (37)$$

- Otherwise, if gcmp\_mapping\_function\_type is equal to 1, the following applies:

$$\begin{aligned} \text{hPos}'' &= \text{Tan}(\text{hPos}' * \pi \div 4) \\ \text{vPos}'' &= \text{Tan}(\text{vPos}' * \pi \div 4) \end{aligned} \quad (38)$$

- Otherwise (gcmp\_mapping\_function\_type is equal to 2), the following applies:

$$\begin{aligned} \text{coeffU}[n] &= (\text{gcmp\_function\_coeff\_u}[n] + 1) \div 128 \\ \text{coeffV}[n] &= (\text{gcmp\_function\_coeff\_v}[n] + 1) \div 128 \\ \text{hPos}'' &= \text{hPos}' \div (1 + \text{coeffU}[n] * (1 - \text{gcmp\_function\_u\_affected\_by\_v\_flag}[n] * \text{vPos}''^2) * \\ &\quad (1 - \text{hPos}''^2)) \end{aligned} \quad (39)$$

$$vPos'' = vPos' \div (1 + coeffV[n] * (1 - gcmp\_function\_v\_affected\_by\_u\_flag[n] * hPos'^2) * (1 - vPos'^2))$$

– The following applies:

```

if( gcmp_face_index[ n ] == 0 ) { /* positive x front face */
  x = 1.0
  y = hPos''
  z = vPos''
} else if( gcmp_face_index[ n ] == 1 ) { /* negative x back face */
  x = -1.0
  y = -vPos''
  z = -hPos''
} else if( gcmp_face_index[ n ] == 2 ) { /* positive z top face */
  x = -hPos''
  y = -vPos''
  z = 1.0
} else if( gcmp_face_index[ n ] == 3 ) { /* negative z bottom face */
  x = hPos''
  y = -vPos''
  z = -1.0
} else if( gcmp_face_index[ n ] == 5 ) { /* positive y left face */
  x = -hPos''
  y = 1.0
  z = vPos''
} else { /* ( gcmp_face_index[ n ] == 4 ), negative y right face */
  x = hPos''
  y = -1.0
  z = vPos''
}
}
φ = Atan2( y, x ) * 180 ÷ π
θ = Asin( z ÷ Sqrt( x2 + y2 + z2 ) ) * 180 ÷ π

```

### 8.15.1.3 Conversion from the local coordinate axes to the global coordinate axes

Inputs to this process are:

- rotation\_yaw ( $\alpha_d$ ), rotation\_pitch ( $\beta_d$ ), rotation\_roll ( $\gamma_d$ ), all in units of degrees, and
- sphere coordinates ( $\phi_d, \theta_d$ ) relative to the local coordinate axes.

Outputs of this process are:

- sphere coordinates ( $\phi', \theta'$ ) relative to the global coordinate axes.

The outputs are derived as follows:

$$\begin{aligned}
\phi &= \phi_d * \pi \div 180 \\
\theta &= \theta_d * \pi \div 180 \\
\alpha &= \alpha_d * \pi \div 180 \\
\beta &= \beta_d * \pi \div 180 \\
\gamma &= \gamma_d * \pi \div 180 \\
x_1 &= \text{Cos}(\phi) * \text{Cos}(\theta) \\
y_1 &= \text{Sin}(\phi) * \text{Cos}(\theta) \\
z_1 &= \text{Sin}(\theta) \\
x_2 &= \text{Cos}(\beta) * \text{Cos}(\alpha) * x_1 - \text{Cos}(\beta) * \text{Sin}(\alpha) * y_1 + \text{Sin}(\beta) * z_1 \\
y_2 &= (\text{Cos}(\gamma) * \text{Sin}(\alpha) + \text{Sin}(\gamma) * \text{Sin}(\beta) * \text{Cos}(\alpha)) * x_1 + \\
&\quad (\text{Cos}(\gamma) * \text{Cos}(\alpha) - \text{Sin}(\gamma) * \text{Sin}(\beta) * \text{Sin}(\alpha)) * y_1 - \\
&\quad \text{Sin}(\gamma) * \text{Cos}(\beta) * z_1 \\
z_2 &= (\text{Sin}(\gamma) * \text{Sin}(\alpha) - \text{Cos}(\gamma) * \text{Sin}(\beta) * \text{Cos}(\alpha)) * x_1 + \\
&\quad (\text{Sin}(\gamma) * \text{Cos}(\alpha) + \text{Cos}(\gamma) * \text{Sin}(\beta) * \text{Sin}(\alpha)) * y_1 + \\
&\quad \text{Cos}(\gamma) * \text{Cos}(\beta) * z_1 \\
\phi' &= \text{Atan2}(y_2, x_2) * 180 \div \pi \\
\theta' &= \text{Asin}(z_2) * 180 \div \pi
\end{aligned}$$

#### 8.15.1.4 Conversion of sample locations for rectangular region-wise packing

Inputs to this process are:

- sample location (x, y) within the packed region, where x and y are in relative region-wise packed picture sample units, while the sample location is at an integer sample location within the packed picture,
- the width and the height (projRegWidth, projRegHeight) of the projected region, in relative projected picture sample units,
- the width and the height (packedRegWidth, packedRegHeight) of the packed region, in relative region-wise packed picture sample units,
- transform type (transformType), and
- offset values for the sampling position (offsetX, offsetY) in the range of 0, inclusive, to 1, exclusive, in horizontal and vertical relative region-wise packed picture sample units, respectively.

NOTE – offsetX and offsetY both being equal to 0.5 indicates a sampling position that is at the centre point of a sample in packed picture sample units.

Outputs of this process are:

- the centre point of the sample location (hPos, vPos) within the projected region in relative projected picture sample units, where hPos and vPos could have non-integer real values.

The outputs are derived as follows:

```
if( transformType == 0 || transformType == 1 || transformType == 2 || transformType == 3 ) {
    horRatio = projRegWidth ÷ packedRegWidth
    verRatio = projRegHeight ÷ packedRegHeight
} else if ( transformType == 4 || transformType == 5 || transformType == 6 ||
    transformType == 7 ) {
    horRatio = projRegWidth ÷ packedRegHeight
    verRatio = projRegHeight ÷ packedRegWidth
}
if( transformType == 0 ) {
    hPos = horRatio * ( x + offsetX )
    vPos = verRatio * ( y + offsetY )
} else if ( transformType == 1 ) {
    hPos = horRatio * ( packedRegWidth - x - offsetX )
    vPos = verRatio * ( y + offsetY )
} else if ( transformType == 2 ) {
    hPos = horRatio * ( packedRegWidth - x - offsetX )
    vPos = verRatio * ( packedRegHeight - y - offsetY )
} else if ( transformType == 3 ) {
    hPos = horRatio * ( x + offsetX )
    vPos = verRatio * ( packedRegHeight - y - offsetY )
} else if ( transformType == 4 ) {
    hPos = horRatio * ( y + offsetY )
    vPos = verRatio * ( x + offsetX )
} else if ( transformType == 5 ) {
    hPos = horRatio * ( y + offsetY )
    vPos = verRatio * ( packedRegWidth - x - offsetX )
} else if ( transformType == 6 ) {
    hPos = horRatio * ( packedRegHeight - y - offsetY )
    vPos = verRatio * ( packedRegWidth - x - offsetX )
} else if ( transformType == 7 ) {
    hPos = horRatio * ( packedRegHeight - y - offsetY )
    vPos = verRatio * ( x + offsetX )
}
```

(42)

#### 8.15.1.5 Mapping of luma sample locations within a cropped decoded picture to sphere coordinates relative to the global coordinate axes

This clause specifies the semantics of luma sample locations within a cropped decoded picture to sphere coordinates relative to the global coordinate axes.

offsetX is set equal to 0.5 and offsetY is set equal to 0.5.

If `RegionWisePackingFlag` is equal to 1, the following applies for each packed region `n` in the range of 0 to `NumPackedRegions - 1`, inclusive:

- For each sample location (`xPackedPicture`, `yPackedPicture`) belonging to the `n`-th packed region, the following applies:
  - The corresponding sample location (`xProjPicture`, `yProjPicture`) of the projected picture is derived as follows:
    - `x` is set equal to `xPackedPicture - PackedRegionLeft[ n ]`.
    - `y` is set equal to `yPackedPicture - PackedRegionTop[ n ]`.
    - Clause 8.15.1.4 is invoked with `x`, `y`, `PackedRegionWidth[ n ]`, `PackedRegionHeight[ n ]`, `ProjRegionWidth[ n ]`, `ProjRegionHeight[ n ]`, `TransformType[ n ]`, `offsetX` and `offsetY` as inputs, and the output is assigned to sample location (`hPos`, `vPos`).
    - `xProjPicture` is set equal to `ProjRegionLeft[ n ] + hPos`.
    - When `StereoFlag` is equal to 0 or `TopBottomFlag` is equal to 1, and when `xProjPicture` is greater than or equal to `rwp_proj_picture_width`, `xProjPicture` is set equal to `xProjPicture - rwp_proj_picture_width`.
    - When `SideBySideFlag` is equal to 1, the following applies:
      - When `ProjRegionLeft[ n ]` is less than `rwp_proj_picture_width / 2` and `xProjPicture` is greater than or equal to `rwp_proj_picture_width / 2`, `xProjPicture` is set equal to `xProjPicture - rwp_proj_picture_width / 2`.
      - When `ProjRegionLeft[ n ]` is greater than or equal to `rwp_proj_picture_width / 2` and `xProjPicture` is greater than or equal to `rwp_proj_picture_width`, `xProjPicture` is set equal to `xProjPicture - rwp_proj_picture_width / 2`.
    - `yProjPicture` is set equal to `ProjRegionTop[ n ] + vPos`.
  - Clause 8.15.1.6 is invoked with `xProjPicture`, `yProjPicture`, `ConstituentPicWidth`, and `ConstituentPicHeight` as inputs, and the outputs indicating the sphere coordinates and the constituent picture index (for frame-packed stereoscopic video) for the luma sample location (`xPackedPicture`, `yPackedPicture`) belonging to the `n`-th packed region in the decoded picture.

Otherwise if `RegionWisePackingFlag` is equal 0 and `CmpFlag` is equal to 1, the following applies for each sample location (`x`, `y`) that is not a cubemap projection guard band sample within the cropped decoded picture:

- `xProjPicture` is set equal to `x + offsetX`.
- `yProjPicture` is set equal to `y + offsetY`.
- Clause 8.15.1.6 is invoked with `xProjPicture`, `yProjPicture`, `ConstituentPicWidth`, and `ConstituentPicHeight` as inputs, and the outputs indicating the sphere coordinates and the constituent picture index (for frame-packed stereoscopic video) for the sample location (`x`, `y`) within the cropped decoded picture.

Otherwise (`RegionWisePackingFlag` is equal to 0, and `CmpFlag` is equal to 0), the following applies for each sample location (`x`, `y`) that is not an equirectangular projection guard band sample within the cropped decoded picture, where a sample location (`x`, `y`) is an equirectangular projection guard band sample when and only when `ErpFlag` is equal to 1, `x` is in the range of 0 to `erp_left_guard_band_width - 1`, inclusive, or `ConstituentPicWidth - erp_right_guard_band_width` to `ConstituentPicWidth - 1`, inclusive, and `y` is in the range of 0 to `ConstituentPicHeight - 1`, inclusive:

- `xProjPicture` is set equal to `x + offsetX`.
- `yProjPicture` is set equal to `y + offsetY`.
- If `ErpFlag` is equal to 0, `projPicWidth` is set equal to `ConstituentPicWidth`. Otherwise (`ErpFlag` is equal to 1), `projPicWidth` is set equal to `ConstituentPicWidth - (erp_left_guard_band_width + erp_right_guard_band_width)`.
- Clause 8.15.1.6 is invoked with `xProjPicture`, `yProjPicture`, `projPicWidth`, and `ConstituentPicHeight` as inputs, and the outputs indicating the sphere coordinates and the constituent picture index (for frame-packed stereoscopic video) for the sample location (`x`, `y`) within the region-wise packed picture.

#### **8.15.1.6 Conversion from a sample location in a projected picture to sphere coordinates relative to the global coordinate axes**

Inputs to this process are:

- the centre point of a sample location (`xProjPicture`, `yProjPicture`) within a projected picture, where `xProjPicture` and `yProjPicture` are in relative projected picture sample units and could have non-integer real values, and

- pictureWidth and pictureHeight, which are the width and height, respectively, of a monoscopic projected luma picture, in relative projected picture sample units.

Outputs of this process are:

- sphere coordinates (azimuthGlobal, elevationGlobal), in units of degrees relative to the global coordinate axes, and
- when StereoFlag is equal to 1, the index of the constituent picture (constituentPicture) equal to 0 or 1.

The outputs are derived with the following ordered steps:

1. constituentPicture, xProjPicture, and yProjPicture are conditionally set as follows:
  - If xProjPicture is greater than or equal to pictureWidth or yProjPicture is greater than or equal to pictureHeight, the following applies:
    - constituentPicture is set equal to 1.
    - When xProjPicture is greater than or equal to pictureWidth, xProjPicture is set to xProjPicture – pictureWidth.
    - When yProjPicture is greater than or equal to pictureHeight, yProjPicture is set to yProjPicture – pictureHeight.
  - Otherwise, constituentPicture is set equal to 0.
2. Clause 8.15.1.2 is invoked with pictureWidth, pictureHeight, xProjPicture, and yProjPicture as inputs, and the output is assigned to azimuthLocal, elevationLocal.
3. azimuthGlobal and elevationGlobal are set as follows:
  - If RotationFlag is equal to 1, clause 8.15.1.3 is invoked with azimuthLocal, elevationLocal, RotationYaw, RotationPitch, and RotationRoll as inputs, and the output is assigned to azimuthGlobal and elevationGlobal.
  - Otherwise, azimuthGlobal is set equal to azimuthLocal and elevationGlobal is set equal to elevationLocal.

#### 8.15.1.7 Calculation of the cubemap face size for a projected picture

Inputs to this process are:

- pictureWidth and pictureHeight, which are the width and height, respectively, of a monoscopic projected luma picture, in relative projected picture sample units.

Outputs of this process are:

- faceWidth and faceHeight, which are the width and height, respectively, of a projected face, in relative projected picture sample units.

The outputs are derived as follows:

```

gcmpPicWidth = pictureWidth
gcmpPicHeight = pictureHeight
gcmpGuardBandSamples = gcmp_guard_band_flag ? gcmp_guard_band_samples_minus1 + 1 : 0
if( gcmp_guard_band_flag && gcmp_guard_band_boundary_exterior_flag ) {
    gcmpPicWidth = pictureWidth - 2 * gcmpGuardBandSamples
    gcmpPicHeight = pictureHeight - 2 * gcmpGuardBandSamples
}
if( gcmp_packing_type == 0 ) {
    if( gcmp_guard_band_flag )
        gcmpPicHeight -= 2 * gcmpGuardBandSamples
    faceWidth = gcmpPicWidth
    faceHeight = gcmpPicHeight / 6
} else if( gcmp_packing_type == 1 ) {
    if( gcmp_guard_band_flag )
        gcmpPicWidth -= 2 * gcmpGuardBandSamples
    faceWidth = gcmpPicWidth / 2
    faceHeight = gcmpPicHeight / 3
} else if( gcmp_packing_type == 2 ) {
    if( gcmp_guard_band_flag )
        gcmpPicHeight -= 2 * gcmpGuardBandSamples
    faceWidth = gcmpPicWidth / 3

```

```

        faceHeight = gcmpPicHeight / 2
    } else if( gcmp_packing_type == 3 ) {
        if( gcmp_guard_band_flag )
            gcmpPicWidth -= 2 * gcmpGuardBandSamples
        faceWidth = gcmpPicWidth / 6
        faceHeight = gcmpPicHeight
    } else if( gcmp_packing_type == 4 ) {
        if( gcmp_guard_band_flag )
            gcmpPicWidth -= 2 * gcmpGuardBandSamples
        faceWidth = gcmpPicWidth / 3
        faceHeight = gcmpPicHeight
    } else if( gcmp_packing_type == 5 ) {
        if( gcmp_guard_band_flag )
            gcmpPicHeight -= 2 * gcmpGuardBandSamples
        faceWidth = gcmpPicWidth
        faceHeight = gcmpPicHeight / 3
    }

```

(43)

The values of faceWidth and faceHeight are constrained as follows:

- If gcmp\_packing\_type is equal to 4, the following constraints apply:
  - When ChromaFormatIdc is equal to 1 (4:2:0 chroma format) or 2 (4:2:2 chroma format), faceWidth shall be a multiple of 4 in units of luma samples.
  - When ChromaFormatIdc is equal to 1 (4:2:0 chroma format), faceHeight shall be a multiple of 2 in units of luma samples.
- Otherwise, if gcmp\_packing\_type is equal to 5, the following constraints apply:
  - When ChromaFormatIdc is equal to 1 (4:2:0 chroma format) or 2 (4:2:2 chroma format), faceWidth shall be a multiple of 2 in units of luma samples.
  - When ChromaFormatIdc is equal to 1 (4:2:0 chroma format), faceHeight shall be a multiple of 4 in units of luma samples.
- Otherwise, the following constraints apply:
  - When ChromaFormatIdc is equal to 1 (4:2:0 chroma format) or 2 (4:2:2 chroma format), faceWidth shall be a multiple of 2 in units of luma samples.
  - When ChromaFormatIdc is equal to 1 (4:2:0 chroma format), faceHeight shall be a multiple of 2 in units of luma samples.

It is a requirement of bitstream conformance that the following constraints apply:

- If gcmp\_packing\_type is equal to 0, gcmpPicHeight shall be a multiple of 6, and gcmpPicWidth shall be equal to gcmpPicHeight / 6.
- Otherwise, if gcmp\_packing\_type is equal to 1, gcmpPicWidth shall be a multiple of 2 and gcmpPicHeight shall be a multiple of 3, and gcmpPicWidth / 2 shall be equal to gcmpPicHeight / 3.
- Otherwise, if gcmp\_packing\_type is equal to 2, gcmpPicWidth shall be a multiple of 3 and gcmpPicHeight shall be a multiple of 2, and gcmpPicWidth / 3 shall be equal to gcmpPicHeight / 2.
- Otherwise, if gcmp\_packing\_type is equal to 3, gcmpPicWidth shall be a multiple of 6, and gcmpPicWidth / 6 shall be equal to gcmpPicHeight.
- Otherwise, if gcmp\_packing\_type is equal to 4, gcmpPicWidth shall be a multiple of 6, and gcmpPicWidth / 3 shall be equal to gcmpPicHeight.
- Otherwise, if gcmp\_packing\_type is equal to 5, gcmpPicHeight shall be a multiple of 6, and gcmpPicWidth shall be equal to gcmpPicHeight / 3.

#### 8.15.1.8 Conversion from a sample location in a projected picture to a sample location in a projected cubemap face

Inputs to this process are:

- sample location (hPos, vPos) within the projected picture in relative projected picture sample units, where hPos and vPos could have non-integer real values, and

- faceWidth and faceHeight, which are the width and height, respectively, of the projected face, in relative projected picture sample units.

Outputs of this process are:

- the sample location (hPosFace, vPosFace) within the projected face in relative projected picture sample units, where hPosFace and vPosFace could have non-integer real values.

The outputs are derived as follows:

```

gbSize = gcmpGuardBandSamples
tmpHorPos = hPos
tmpVerPos = vPos
if( gcmp_guard_band_flag ) {
    if( gcmp_guard_band_boundary_exterior_flag ) {
        tmpHorPos = hPos - gbSize
        tmpVerPos = vPos - gbSize
    }
    if( gcmp_packing_type == 0 )
        tmpVerPos = tmpVerPos < 3 * faceHeight ? tmpVerPos : tmpVerPos - 2 * gbSize
    else if( gcmp_packing_type == 1 )
        tmpHorPos = tmpHorPos < faceWidth ? tmpHorPos : tmpHorPos - 2 * gbSize
    else if( gcmp_packing_type == 2 )
        tmpVerPos = tmpVerPos < faceHeight ? tmpVerPos : tmpVerPos - 2 * gbSize
    else if( gcmp_packing_type == 3 )
        tmpHorPos = tmpHorPos < 3 * faceWidth ? tmpHorPos : tmpHorPos - 2 * gbSize
    else if( gcmp_packing_type == 4 )
        tmpHorPos = tmpHorPos < faceWidth / 2 ? tmpHorPos : tmpHorPos < 2.5 * faceWidth + gbSize ?
            tmpHorPos - gbSize : tmpHorPos - 2 * gbSize
    else if( gcmp_packing_type == 5 )
        tmpVerPos = tmpVerPos < faceHeight / 2 ? tmpVerPos : tmpVerPos < 2.5 * faceHeight + gbSize ?
            tmpVerPos - gbSize : tmpVerPos - 2 * gbSize
}
w = Floor( tmpHorPos ÷ faceWidth )
h = Floor( tmpVerPos ÷ faceHeight )
hPosFace = tmpHorPos - w * faceWidth
vPosFace = tmpVerPos - h * faceHeight

```

#### 8.15.1.9 Rotation of sample locations for a projected cubemap face

Inputs to this process are:

- sample location (hPosFace, vPosFace) within the n-th projected face in relative projected picture sample units, where hPosFace and vPosFace could have non-integer real values, and
- faceWidth and faceHeight, which are the width and height, respectively, of the projected face, in relative projected picture sample units.

Outputs of this process are:

- the rotated sample location (hPosRot, vPosRot) within the projected face in relative projected picture sample units, where hPosRot and vPosRot could have non-integer real values.

The outputs are derived as follows:

```

if( gcmp_face_rotation[ n ] == 0 ) {
    hPosRot = hPosFace
    vPosRot = vPosFace
} else if( gcmp_face_rotation[ n ] == 1 ) {
    hPosRot = vPosFace
    vPosRot = faceWidth - hPosFace
} else if( gcmp_face_rotation[ n ] == 2 ) {
    hPosRot = faceWidth - hPosFace
    vPosRot = faceHeight - vPosFace
} else if( gcmp_face_rotation[ n ] == 3 ) {
    hPosRot = faceHeight - vPosFace
    vPosRot = hPosFace
}

```

### 8.15.1.10 Adjustment of a sample location for hemisphere cubemap projection

Inputs to this process are:

- sample location (hPosRot, vPosRot) within the n-th projected face in relative projected picture sample units, where hPosRot and vPosRot could have non-integer real values, and
- faceWidth and faceHeight, which are the width and height, respectively, of the projected face, in relative projected picture sample units.

Outputs of this process are:

- the adjusted sample location (hPosAdj, vPosAdj) within the n-th projected face in relative projected picture sample units, where hPosAdj and vPosAdj could have non-integer real values.

The outputs are derived as follows:

```

leftFaceIdx = {5, 3, 1, 0, 0, 1}
rightFaceIdx = {4, 2, 0, 1, 1, 0}
topFaceIdx = {2, 4, 4, 4, 2, 2}
bottomFaceIdx = {3, 5, 5, 5, 3, 3}
hPosAdj = hPosRot
vPosAdj = vPosRot
if( n != 2 )
    if( face_index[ 2 ] == leftFaceIdx[ face_index[ n ] ] && hPosAdj >= faceWidth / 2 )
        hPosAdj -= faceWidth / 2
    else if( face_index[ 2 ] == rightFaceIdx[ face_index[ n ] ] && hPosAdj < faceWidth / 2 )
        hPosAdj += faceWidth / 2
    else if( face_index[ 2 ] == topFaceIdx[ face_index[ n ] ] && vPosAdj >= faceHeight / 2 )
        vPosAdj -= faceHeight / 2
    else if( face_index[ 2 ] == bottomFaceIdx[ face_index[ n ] ] && vPosAdj < faceHeight / 2 )
        vPosAdj += faceHeight / 2

```

(46)

## 8.15.2 Equirectangular projection SEI message

### 8.15.2.1 Equirectangular projection SEI message syntax

	<b>Descriptor</b>
equirectangular_projection( payloadSize ) {	
<b>erp_cancel_flag</b>	u(1)
if( !erp_cancel_flag ) {	
<b>erp_persistence_flag</b>	u(1)
<b>erp_guard_band_flag</b>	u(1)
<b>erp_reserved_zero_2bits</b>	u(2)
if( erp_guard_band_flag == 1 ) {	
<b>erp_guard_band_type</b>	u(3)
<b>erp_left_guard_band_width</b>	u(8)
<b>erp_right_guard_band_width</b>	u(8)
}	
}	
}	

### 8.15.2.2 Equirectangular projection SEI message semantics

The equirectangular projection SEI message provides information to enable remapping (through an equirectangular projection) of the colour samples of the projected pictures onto a sphere coordinate space in sphere coordinates ( $\phi$ ,  $\theta$ ) for use in omnidirectional video applications for which the viewing perspective is from the origin looking outward toward the inside of the sphere. The sphere coordinates are defined so that  $\phi$  is the azimuth (longitude, increasing eastward) and  $\theta$  is the elevation (latitude, increasing northward).

Use of this SEI message requires the definition of the following variable:

- A chroma format indicator, denoted herein by ChromaFormatIdc, as described in clause 7.3.

When an equirectangular projection SEI message is present for any picture of a CLVS, an equirectangular projection SEI message shall be present for the first picture of the CLVS and no SEI message indicating a different type of projection shall be present for any picture of the CLVS.

When the SAR for a picture is indicated by `vui_aspect_ratio_idc` or `sari_aspect_ratio_idc` greater than 1, there should be no equirectangular projection SEI messages applicable for the picture.

A frame packing arrangement SEI message for which all the following conditions are true is referred to as an effectively applicable frame packing arrangement SEI message:

- The value of `fp_arrangement_cancel_flag` is equal to 0.
- The value of `fp_arrangement_type` is equal to 3, 4, or 5.
- The value of `fp_quincunx_sampling_flag` is equal to 0.
- The value of `fp_spatial_flipping_flag` is equal to 0.
- The value of `fp_field_views_flag` is equal to 0.
- The value of `fp_frame0_grid_position_x` is equal to 0.
- The value of `fp_frame0_grid_position_y` is equal to 0.
- The value of `fp_frame1_grid_position_x` is equal to 0.
- The value of `fp_frame1_grid_position_y` is equal to 0.

When a frame packing arrangement SEI message with `fp_arrangement_cancel_flag` equal to 0 that applies to the picture is present that is not an effectively applicable frame packing arrangement SEI message, an equirectangular projection SEI message with `erp_cancel_flag` equal to 0 that applies to the picture shall not be present. Decoders shall ignore equirectangular projection SEI messages when a frame packing arrangement SEI message with `fp_arrangement_cancel_flag` equal to 0 that applies to the picture is present that is not an effectively applicable frame packing arrangement SEI message.

**erp\_cancel\_flag** equal to 1 indicates that the SEI message cancels the persistence of any previous equirectangular projection SEI message in output order. `erp_cancel_flag` equal to 0 indicates that equirectangular projection information follows.

**erp\_persistence\_flag** specifies the persistence of the equirectangular projection SEI message for the current layer.

`erp_persistence_flag` equal to 0 specifies that the equirectangular projection SEI message applies to the current decoded picture only.

`erp_persistence_flag` equal to 1 specifies that the equirectangular projection SEI message applies to the current decoded picture and persists for all subsequent pictures of the current layer in output order until one or more of the following conditions are true:

- A new CLVS of the current layer begins.
- The bitstream ends.
- A picture in the current layer in an AU associated with an equirectangular projection SEI message is output that follows the current picture in output order.

**erp\_guard\_band\_flag** equal to 1 indicates that the constituent picture contains guard band areas for which the sizes are specified by the syntax elements `erp_left_guard_band_width` and `erp_right_guard_band_width`. `erp_guard_band_flag` equal to 0 indicates that the constituent picture does not contain guard band areas for which the sizes are specified by the syntax elements `erp_left_guard_band_width` and `erp_right_guard_band_width`.

**erp\_reserved\_zero\_2bits** shall be equal to 0 in bitstreams conforming to this version of this Specification. Other values for `erp_reserved_zero_2bits` are reserved for future use by ITU-T | ISO/IEC. Decoders shall ignore the value of `erp_reserved_zero_2bits`.

**erp\_guard\_band\_type** indicates the type of the guard bands as follows:

- `erp_guard_band_type` equal to 0 indicates that the content of the guard band in relation to the content of the constituent picture is unknown or unspecified or specified by other means not specified in this Specification.
- `erp_guard_band_type` equal to 1 indicates that the content of the guard band suffices for interpolation of sample values at sub-pel sample fractional locations within the constituent picture.

NOTE – `erp_guard_band_type` equal to 1 could be used when the source boundary samples of a constituent picture have been copied horizontally to the guard band.

- `erp_guard_band_type` equal to 2 indicates that the content of the guard band represents actual picture content at a quality that gradually changes from the picture quality of the constituent picture to that of the spherically adjacent region.
- `erp_guard_band_type` equal to 3 indicates that the content of the guard bands represents actual picture content at a similar level of quality as the constituent picture.
- `erp_guard_band_type` values greater than 3 are reserved for future use by ITU-T | ISO/IEC. Decoders shall treat the value of `erp_guard_band_type` when the value is greater than 3 as equivalent to the value 0.

**erp\_left\_guard\_band\_width** specifies the width of the guard band on the left side of the constituent picture in units of luma samples. When `erp_guard_band_flag` is equal to 0, the value of `erp_left_guard_band_width` is inferred to be equal to 0. When `ChromaFormatIdc` is equal to 1 (4:2:0 chroma format) or 2 (4:2:2 chroma format), `erp_left_guard_band_width` shall be an even number.

**erp\_right\_guard\_band\_width** specifies the width of the guard band on the right side of the constituent picture in units of luma samples. When `erp_guard_band_flag` is equal to 0, the value of `erp_right_guard_band_width` is inferred to be equal to 0. When `ChromaFormatIdc` is equal to 1 (4:2:0 chroma format) or 2 (4:2:2 chroma format), `erp_right_guard_band_width` shall be an even number.

#### 8.15.3.2 Generalized cubemap projection SEI message semantics

The generalized cubemap projection SEI message provides information to enable remapping (through a generalized cubemap projection) of the colour samples of the projected pictures onto a sphere coordinate space in sphere coordinates ( $\phi$ ,  $\theta$ ) for use in omnidirectional video applications for which the viewing perspective is from the origin looking outward

toward the inside of the sphere. The sphere coordinates are defined so that  $\phi$  is the azimuth (longitude, increasing eastward) and  $\theta$  is the elevation (latitude, increasing northward).

Use of this SEI message requires the definition of the following variable:

- A chroma format indicator, denoted herein by `ChromaFormatIdc`, as described in clause 7.3.

When a generalized cubemap projection SEI message is present for any picture of a CLVS, a generalized cubemap projection SEI message shall be present for the first picture of the CLVS and no SEI message indicating a different type of projection shall be present for any picture of the CLVS.

When the SAR for a picture is indicated by `vui_aspect_ratio_idc` or `sari_aspect_ratio_idc` greater than 1, there should be no generalized cubemap projection SEI messages applicable for the picture.

A frame packing arrangement SEI message for which all the following conditions are true is referred to as an effectively applicable frame packing arrangement SEI message:

- The value of `fp_arrangement_cancel_flag` is equal to 0.
- The value of `fp_arrangement_type` is equal to 3, 4, or 5.
- The value of `fp_quincunx_sampling_flag` is equal to 0.
- The value of `fp_spatial_flipping_flag` is equal to 0.
- The value of `fp_field_views_flag` is equal to 0.
- The value of `fp_frame0_grid_position_x` is equal to 0.
- The value of `fp_frame0_grid_position_y` is equal to 0.
- The value of `fp_frame1_grid_position_x` is equal to 0.
- The value of `fp_frame1_grid_position_y` is equal to 0.

When a frame packing arrangement SEI message with `fp_arrangement_cancel_flag` equal to 0 that applies to the picture is present that is not an effectively applicable frame packing arrangement SEI message, a generalized cubemap projection SEI message with `gcmp_cancel_flag` equal to 0 that applies to the picture shall not be present. Decoders shall ignore generalized cubemap projection SEI messages when a frame packing arrangement SEI message with `fp_arrangement_cancel_flag` equal to 0 that applies to the picture is present that is not an effectively applicable frame packing arrangement SEI message.

When all of the following conditions are true, the functionality of the generalized cubemap projection SEI message is exactly the same as the cubemap projection SEI message specified in in Rec. ITU-T H.265 | ISO/IEC 23008-2 and Rec. ITU-T H.264 | ISO/IEC 14496-10:

- The value of `gcmp_packing_type` is equal to 2;
- The value of `gcmp_mapping_function_type` is equal to 0;
- The values of `gcmp_face_index[ i ]` for `i` from 0 to 5, inclusive, are equal to 5, 0, 4, 3, 1 and 2, respectively;
- The value of `gcmp_face_rotation[ i ]` is equal to 0 for each value of `i` in the range of 0 to 5, inclusive;
- The value of `gcmp_guard_band_flag` is equal to 0.

**`gcmp_cancel_flag`** equal to 1 indicates that the SEI message cancels the persistence of any previous generalized cubemap projection SEI message in output order. `gcmp_cancel_flag` equal to 0 indicates that cubemap projection information follows.

**`gcmp_persistence_flag`** specifies the persistence of the generalized cubemap projection SEI message for the current layer.

`gcmp_persistence_flag` equal to 0 specifies that the generalized cubemap projection SEI message applies to the current decoded picture only.

`gcmp_persistence_flag` equal to 1 specifies that the generalized cubemap projection SEI message applies to the current decoded picture and persists all subsequent pictures of the current layer in output order until one or more of the following conditions are true:

- A new CLVS of the current layer begins.
- The bitstream ends.
- A picture in the current layer in an AU associated with a cubemap projection SEI message is output that follows the current picture in output order.

**gcmp\_packing\_type** specifies the packing type and the position index of the cubemap packing as specified in Table 10. When the value of **gcmp\_packing\_type** is in the range of 0 to 3, inclusive, cubemap packing with six faces is used. When **gcmp\_packing\_type** is 4 or 5, hemisphere cubemap packing with one full face and four half faces is used. The value of **gcmp\_packing\_type** shall be in the range of 0 to 5, inclusive. Other values for **gcmp\_packing\_type** are reserved for future use by ITU-T | ISO/IEC.

**Table 10 – Specification of packing type and position index based on gcmp\_packing\_type**

**gcmp\_mapping\_function\_type** specifies the mapping function used to adjust the sample locations of the cubemap projection. **gcmp\_mapping\_function\_type** equal to 0 specifies that the same mapping function as specified for the cubemap projection SEI message in Rec. ITU-T H.265 | ISO/IEC 23008-2 and Rec. ITU-T H.264 | ISO/IEC 14496-10 is used. **gcmp\_mapping\_function\_type** equal to 1 specifies that the equi-angular mapping function is applied to adjust the sample locations of the projected face, as defined in clause 8.15.1.2. **gcmp\_mapping\_function\_type** equal to 2 specifies that the coefficients of the mapping function applied to adjust the sample locations of the *i*-th projected face are specified by the syntax elements **gcmp\_function\_coeff\_u[ i ]**, **gcmp\_function\_u\_affected\_by\_v\_flag[ i ]**, **gcmp\_function\_coeff\_v[ i ]**, and **gcmp\_function\_v\_affected\_by\_u\_flag[ i ]**. The value of **gcmp\_mapping\_function\_type** shall be in the range of 0 to 2, inclusive.

**gcmp\_face\_index[ i ]** specifies the face index for position index *i* in **gcmp\_packing\_type** and the relationship between the global coordinates 3D (X, Y, Z) and the local coordinate 2D (u, v) as specified in clause 8.15.1.2.

When `gcmp_packing_type` is equal to 4 or 5, it is a requirement of bitstream conformance that the following constraints apply:

- If `gcmp_face_index[ 2 ]` is equal to 0 or 1, the value of `gcmp_face_index[ i ]` for `i` equal to 0, 1, 3 or 4 shall be in the range of 2 to 5, inclusive.
- Otherwise, if `gcmp_face_index[ 2 ]` is equal to 2 or 3, the value of `gcmp_face_index[ i ]` for `i` equal to 0, 1, 3 or 4 shall be 0, 1, 4, or 5.
- Otherwise, the value of `gcmp_face_index[ i ]` for `i` equal to 0, 1, 3 or 4 shall be in the range of 0 to 3, inclusive.

`gcmp_face_rotation[ i ]` specifies the rotation to be applied to the face on position index `i` as specified in Table 11.

**Table 11 – Specification of counterclockwise rotation angle based on `gcmp_face_rotation[ i ]`**

<code>gcmp_face_rotation[ i ]</code>	Rotation angle in degree (anticlockwise)
0	0
1	90
2	180
3	270

When `gcmp_packing_type` is equal to 4, it is a requirement of bitstream conformance that the following constraints apply:

- If `gcmp_face_index[ 2 ]` is equal to 0 or 1, the value of `gcmp_face_rotation[ i ]` for `i` equal to 0, 1, 3 or 4 shall be 0 or 2.
- Otherwise, if `gcmp_face_index[ 2 ]` is equal to 2 or 3, when `gcmp_face_index[ i ]` is equal to 1, the value of `gcmp_face_rotation[ i ]` shall be 0 or 2, and when `gcmp_face_index[ i ]` is equal to 0, 4 or 5, the value of `gcmp_face_rotation[ i ]` shall be 1 or 3.
- Otherwise, when `gcmp_face_index[ i ]` is equal to 0, the value of `gcmp_face_rotation[ i ]` shall be 0 or 2, and when `gcmp_face_index[ i ]` is equal to 1, 2 or 3, the value of `gcmp_face_rotation[ i ]` shall be 1 or 3.

When `gcmp_packing_type` is equal to 5, it is a requirement of bitstream conformance that the following constraints apply:

- If `gcmp_face_index[ 2 ]` is equal to 0 or 1, the value of `gcmp_face_rotation[ i ]` for `i` equal to 0, 1, 3 or 4 shall be 1 or 3.
- Otherwise, if `gcmp_face_index[ 2 ]` is equal to 2 or 3, when `gcmp_face_index[ i ]` is equal to 1, the value of `gcmp_face_rotation[ i ]` shall be 1 or 3, and when `gcmp_face_index[ i ]` is equal to 0, 4 or 5, the value of `gcmp_face_rotation[ i ]` shall be 0 or 2.
- Otherwise, when `gcmp_face_index[ i ]` is equal to 0, the value of `gcmp_face_rotation[ i ]` shall be 1 or 3, and when `gcmp_face_index[ i ]` is equal to 1, 2 or 3, the value of `gcmp_face_rotation[ i ]` shall be 0 or 2.

`gcmp_function_coeff_u[ i ]` specifies the coefficient used in the cubemap mapping function of the `u`-axis of the `i`-th face. When `gcmp_function_coeff_u[ i ]` is not present, it is inferred to be equal to 0.

`gcmp_function_u_affected_by_v_flag[ i ]` equal to 1 indicates that the cubemap mapping function of the `u`-axis refers to the `v` position of the sample location. `gcmp_function_u_affected_by_v_flag[ i ]` equal to 0 indicates that the cubemap mapping function in `u`-axis does not refer to the `v` position of the sample location.

`gcmp_function_coeff_v[ i ]` specifies the coefficient used in the cubemap mapping function of the `v`-axis of the `i`-th face. When `gcmp_function_coeff_v[ i ]` is not present, it is inferred to be equal to 0.

`gcmp_function_v_affected_by_u_flag[ i ]` equal to 1 indicates that the cubemap mapping function of the `v`-axis refers to the `u` position of the sample location. `gcmp_function_v_affected_by_u_flag[ i ]` equal to 0 indicates that the cubemap mapping function in `v`-axis does not refer to the `u` position of the sample location.

`gcmp_guard_band_flag` equal to 0 indicates that the coded picture does not contain guard band areas. `gcmp_guard_band_flag` equal to 1 indicates that the coded picture contains guard band areas for which the sizes are specified by the syntax element `gcmp_guard_band_samples_minus1`.

`gcmp_guard_band_type` indicates the type of the guard bands as follows:

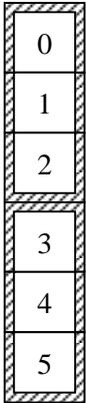

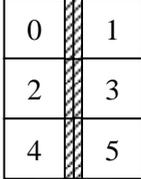

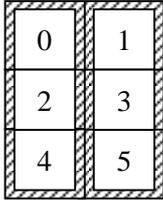

- `gcmp_guard_band_type` equal to 0 indicates that the content of the guard bands in relation to the content of the coded face is unknown or unspecified or specified by other means not specified in this Specification.
- `gcmp_guard_band_type` equal to 1 indicates that the content of the guard bands suffices for interpolation of sample values at sub-pel sample fractional locations within the coded face.

NOTE – gcmp\_guard\_band\_type equal to 1 could be used when the source boundary samples of a coded face have been copied horizontally or vertically to the guard band.

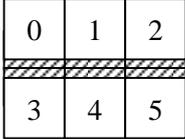

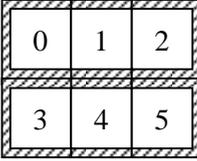

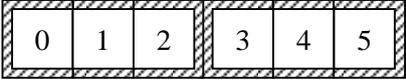

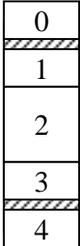

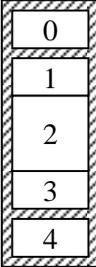

- gcmp\_guard\_band\_type equal to 2 indicates that the content of the guard bands represents actual picture content that is spherically adjacent to the content in the coded face at quality that gradually changes from the picture quality of the coded face to that of the spherically adjacent region.
- gcmp\_guard\_band\_type equal to 3 indicates that the content of the guard bands represents actual picture content that is spherically adjacent to the content in the coded face at a similar picture quality as within the coded face.
- gcmp\_guard\_band\_type values greater than 3 are reserved for future use by ITU-T | ISO/IEC. Decoders shall treat the value of gcmp\_guard\_band\_type when the value is greater than 3 as equivalent to the value 0.

**gcmp\_guard\_band\_boundary\_exterior\_flag** indicates which face boundaries contain guard bands, as specified in Table 12.

**Table 12 – Specification of guard band boundary location based on gcmp\_packing\_type and gcmp\_guard\_band\_boundary\_exterior\_flag**

gcmp_packing_type	gcmp_guard_band_boundary_exterior_flag	Location of guard band
0	0	
0	1	
1	0	
1	1	

**Table 12 – Specification of guard band boundary location based on gcmp\_packing\_type and gcmp\_guard\_band\_boundary\_exterior\_flag**

gcmp_packing_type	gcmp_guard_band_boundary_exterior_flag	Location of guard band
2	0	
2	1	
3	0	
3	1	
4	0	
4	1	
5	0	
5	1	

**gcmp\_guard\_band\_samples\_minus1** plus 1 specifies the number of guard band samples, in units of luma samples, used in the cubemap projected picture. When ChromaFormatIdc is equal to 1 (4:2:0 chroma format) or 2 (4:2:2 chroma format), gcmp\_guard\_band\_samples\_minus1 plus 1 shall correspond to an even number of luma samples within the cropped decoded picture.

#### 8.15.4 Sphere rotation SEI message

##### 8.15.4.1 Sphere rotation SEI message syntax

sphere_rotation( payloadSize ) {	<b>Descriptor</b>
<b>sphere_rotation_cancel_flag</b>	u(1)
if( !sphere_rotation_cancel_flag ) {	

<b>sphere_rotation_persistence_flag</b>	u(1)
<b>sphere_rotation_reserved_zero_6bits</b>	u(6)
<b>yaw_rotation</b>	i(32)
<b>pitch_rotation</b>	i(32)
<b>roll_rotation</b>	i(32)
}	
}	

#### 8.15.4.2 Sphere rotation SEI message semantics

The sphere rotation SEI message provides information on rotation angles yaw ( $\alpha$ ), pitch ( $\beta$ ), and roll ( $\gamma$ ) that are used for conversion between the global coordinate axes and the local coordinate axes.

Relative to an (x, y, z) Cartesian coordinate system, yaw expresses a rotation around the z (vertical, up) axis, pitch rotates around the y (lateral, side-to-side) axis, and roll rotates around the x (back-to-front) axis. Rotations are extrinsic, i.e., around x, y, and z fixed reference axes. The angles increase clockwise when looking from the origin towards the positive end of an axis.

**sphere\_rotation\_cancel\_flag** equal to 1 indicates that the SEI message cancels the persistence of any previous sphere rotation SEI message in output order. **sphere\_rotation\_cancel\_flag** equal to 0 indicates that sphere rotation information follows.

**sphere\_rotation\_persistence\_flag** specifies the persistence of the sphere rotation SEI message for the current layer.

**sphere\_rotation\_persistence\_flag** equal to 0 specifies that the sphere rotation SEI message applies to the current decoded picture only.

**sphere\_rotation\_persistence\_flag** equal to 1 specifies that the sphere rotation SEI message applies to the current decoded picture and persists for all subsequent pictures of the current layer in output order until one or more of the following conditions are true:

- A new CLVS of the current layer begins.
- The bitstream ends.
- A picture in the current layer in an AU associated with a sphere rotation SEI message is output that follows the current picture in output order.

When no omnidirectional video projection is indicated to apply to a picture, e.g., by an equirectangular projection SEI message with **erp\_cancel\_flag** equal to 0 or a generalized cubemap projection SEI message with **gcmp\_cancel\_flag** equal to 0 being present in the CLVS that applies to the picture, a sphere rotation SEI message with **sphere\_rotation\_cancel\_flag** equal to 0 shall not be present in the CLVS that applies to the current picture. Decoders shall ignore sphere rotation SEI messages with **sphere\_rotation\_cancel\_flag** equal to 0 for pictures to which no omnidirectional video projection is indicated to apply.

**sphere\_rotation\_reserved\_zero\_6bits** shall be equal to 0 in bitstreams conforming to this version of this Specification. Other values for **sphere\_rotation\_reserved\_zero\_6bits** are reserved for future use by ITU-T | ISO/IEC. Decoders shall ignore the value of **sphere\_rotation\_reserved\_zero\_6bits**.

**yaw\_rotation** specifies the value of the yaw rotation angle, in units of  $2^{-16}$  degrees. The value of **yaw\_rotation** shall be in the range of  $-180 * 2^{16}$  (i.e., -11 796 480) to  $180 * 2^{16} - 1$  (i.e., 11 796 479), inclusive. When not present, the value of **yaw\_rotation** is inferred to be equal to 0.

**pitch\_rotation** specifies the value of the pitch rotation angle, in units of  $2^{-16}$  degrees. The value of **pitch\_rotation** shall be in the range of  $-90 * 2^{16}$  (i.e., -5 898 240) to  $90 * 2^{16}$  (i.e., 5 898 240), inclusive. When not present, the value of **pitch\_rotation** is inferred to be equal to 0.

**roll\_rotation** specifies the value of the roll rotation angle, in units of  $2^{-16}$  degrees. The value of **roll\_rotation** shall be in the range of  $-180 * 2^{16}$  (i.e., -11 796 480) to  $180 * 2^{16} - 1$  (i.e., 11 796 479), inclusive. When not present, the value of **roll\_rotation** is inferred to be equal to 0.

### 8.15.5.2 Region-wise packing SEI message semantics

The RWP SEI message provides information to enable remapping of the colour samples of the cropped decoded pictures onto projected pictures as well as information on the location and size of the guard bands, if any.

Use of this SEI message requires the definition of the following variable:

- A chroma format indicator, denoted herein by ChromaFormatIdc, as described in clause 7.3.

**rwp\_cancel\_flag** equal to 1 indicates that the SEI message cancels the persistence of any previous RWP SEI message in output order. **rwp\_cancel\_flag** equal to 0 indicates that RWP information follows.

**rwp\_persistence\_flag** specifies the persistence of the RWP SEI message for the current layer.

rwp\_persistence\_flag equal to 0 specifies that the RWP SEI message applies to the current decoded picture only.

rwp\_persistence\_flag equal to 1 specifies that the RWP SEI message applies to the current decoded picture and persists for all subsequent pictures of the current layer in output order until one or more of the following conditions are true:

- A new CLVS of the current layer begins.
- The bitstream ends.
- A picture in the current layer in an AU associated with a RWP SEI message is output that follows the current picture in output order.

When no omnidirectional video projection is indicated to apply to a picture, e.g., by an equirectangular projection SEI message with erp\_cancel\_flag equal to 0 or a generalized cubemap projection SEI message with gmcp\_cancel\_flag equal to 0 being present in the CLVS that applies to the current picture, a RWP SEI message with rwp\_cancel\_flag equal to 0 shall not be present in the CLVS that applies to the picture. Decoders shall ignore RWP SEI messages with rwp\_cancel\_flag equal to 0 for pictures to which no omnidirectional video projection is indicated to apply.

When an equirectangular projection SEI message with erp\_cancel\_flag equal to 0 and erp\_guard\_band\_flag equal to 1 is present in the CLVS that applies to the current picture, a RWP SEI message with rwp\_cancel\_flag equal to 0 shall not be present in the CLVS that applies to the current picture.

When a generalized cubemap projection SEI message with gmcp\_cancel\_flag equal to 0 is present in the CLVS that applies to the current picture and precedes the RWP SEI message in decoding order, a RWP SEI message with rwp\_cancel\_flag equal to 0 shall not be present in the CLVS that applies to the current picture unless all the following conditions are true for the generalized cubemap projection SEI message:

- The value of gmcp\_packing\_type is equal to 2;
- The values of gmcp\_face\_index[ i ] for i from 0 to 5, inclusive, are equal to 5, 0, 4, 3, 1 and 2, respectively;
- The value of gmcp\_face\_rotation[ i ] is equal to 0 for each value of i in the range of 0 to 5, inclusive;
- The value of gmcp\_guard\_band\_flag is equal to 0.

For the frame packing arrangement scheme indicated by a frame packing arrangement SEI message that applies to the current picture, if a RWP SEI message with rwp\_cancel\_flag equal to 0 is present that applies to the current picture, the frame packing arrangement scheme applies to the projected picture, otherwise, the frame packing arrangement scheme applies to the cropped decoded picture.

If a frame packing arrangement SEI message with fp\_arrangement\_cancel\_flag equal to 0, fp\_arrangement\_type equal to 3, 4, or 5, and fp\_quincunx\_sampling\_flag equal to 0 is not present that applies to the current picture, the variables StereoFlag, TopBottomFlag, SideBySideFlag, and TempInterleavingFlag are all set equal to 0, the variables HorDiv1 and VerDiv1 are both set equal to 1. Otherwise the following applies:

- StereoFlag is set equal to 1.
- When the fp\_arrangement\_type is equal to 3, SideBySideFlag is set equal to 1, TopBottomFlag and TempInterleavingFlag are both set equal to 0, HorDiv1 is set equal to 2 and VerDiv1 is set equal to 1.
- When the fp\_arrangement\_type is equal to 4, TopBottomFlag is set equal to 1, SideBySideFlag and TempInterleavingFlag are both set equal to 0, HorDiv1 is set equal to 1 and VerDiv1 is set equal to 2.
- When the fp\_arrangement\_type is equal to 5, TempInterleavingFlag is set equal to 1, TopBottomFlag and SideBySideFlag are both set equal to 0, HorDiv1 and VerDiv1 are both set equal to 1.

**rwp\_constituent\_picture\_matching\_flag** equal to 1 specifies that the projected region information, packed region information, and guard band region information in this SEI message apply individually to each constituent picture and that the packed picture and the projected picture have the same stereoscopic frame packing format indicated by the frame packing arrangement SEI message. rwp\_constituent\_picture\_matching\_flag equal to 0 specifies that the projected region information, packed region information, and guard band region information in this SEI message apply to the projected picture.

When either of the following conditions is true, the value of rwp\_constituent\_picture\_matching\_flag shall be equal to 0:

- StereoFlag is equal to 0.
- StereoFlag is equal to 1 and fp\_arrangement\_type is equal to 5.

**rwp\_reserved\_zero\_5bits** shall be equal to 0 in bitstreams conforming to this version of this Specification. Other values for **rwp\_reserved\_zero\_5bits[ i ]** are reserved for future use by ITU-T | ISO/IEC. Decoders shall ignore the value of **rwp\_reserved\_zero\_5bits[ i ]**.

**rwp\_num\_packed\_regions** specifies the number of packed regions when **rwp\_constituent\_picture\_matching\_flag** is equal to 0. The value of **rwp\_num\_packed\_regions** shall be greater than 0. When **rwp\_constituent\_picture\_matching\_flag** is equal to 1, the total number of packed regions is equal to **rwp\_num\_packed\_regions \* 2**, and the information in each entry of the loop of **rwp\_num\_packed\_regions** entries applies to each constituent picture of the projected picture and the packed picture.

**rwp\_proj\_picture\_width** and **rwp\_proj\_picture\_height** specify the width and height, respectively, of the projected picture, in relative projected picture sample units.

NOTE 1 – Relative project picture sample unit is the unit used for the width or height of a projected picture or projected region. When a projected picture is a region-wise packed picture (i.e., there is a one-to-one mapping between the projected picture samples and the region-wise packed picture samples and a relative project picture sample unit is equivalent to a relative region-wise packed picture sample unit), **rwp\_proj\_picture\_width** and **rwp\_proj\_picture\_height** would have such values that **rwp\_proj\_picture\_width** is an integer multiple of **cropPicWidth** and **rwp\_proj\_picture\_height** is an integer multiple of **cropPicHeight**, where **cropPicWidth** and **cropPicHeight** are the width and height, respectively, of the cropped decoded picture, in units of luma samples.

The values of **rwp\_proj\_picture\_width** and **rwp\_proj\_picture\_height** shall both be greater than 0.

**rwp\_packed\_picture\_width** and **rwp\_packed\_picture\_height** specify the width and height, respectively, of the packed picture, in relative region-wise packed picture sample units.

The values of **rwp\_packed\_picture\_width** and **rwp\_packed\_picture\_height** shall both be greater than 0.

It is a requirement of bitstream conformance that **rwp\_packed\_picture\_width** and **rwp\_packed\_picture\_height** shall have such values that **rwp\_packed\_picture\_width** is an integer multiple of **cropPicWidth** and **rwp\_packed\_picture\_height** is an integer multiple of **cropPicHeight**, where **cropPicWidth** and **cropPicHeight** are the width and height, respectively, of the cropped decoded picture, in units of luma samples.

**rwp\_reserved\_zero\_4bits[ i ]** shall be equal to 0 in bitstreams conforming to this version of this Specification. Other values for **rwp\_reserved\_zero\_4bits[ i ]** are reserved for future use by ITU-T | ISO/IEC. Decoders shall ignore the value of **rwp\_reserved\_zero\_4bits[ i ]**.

**rwp\_transform\_type[ i ]** specifies the rotation and mirroring to be applied to the i-th packed region to remap to the i-th projected region. When **rwp\_transform\_type[ i ]** specifies both rotation and mirroring, rotation applies before mirroring. The values of **rwp\_transform\_type[ i ]** are specified in Table 13.

**Table 13 – rwp\_transform\_type[ i ] values**

Value	Description
0	no transform
1	mirroring horizontally
2	rotation by 180 degrees (anticlockwise)
3	rotation by 180 degrees (anticlockwise) before mirroring horizontally
4	rotation by 90 degrees (anticlockwise) before mirroring horizontally
5	rotation by 90 degrees (anticlockwise)
6	rotation by 270 degrees (anticlockwise) before mirroring horizontally
7	rotation by 270 degrees (anticlockwise)

**rwp\_guard\_band\_flag[ i ]** equal to 0 specifies that the i-th packed region does not have a guard band. **rwp\_guard\_band\_flag[ i ]** equal to 1 specifies that the i-th packed region has a guard band.

**rwp\_proj\_region\_width[ i ]**, **rwp\_proj\_region\_height[ i ]**, **rwp\_proj\_region\_top[ i ]** and **rwp\_proj\_region\_left[ i ]** specify the width, height, top sample row, and the left-most sample column, respectively, of the i-th projected region, either within the projected picture (when **rwp\_constituent\_picture\_matching\_flag** is equal to 0) or within the constituent picture of the projected picture (when **rwp\_constituent\_picture\_matching\_flag** is equal to 1).

**rwp\_proj\_region\_width[ i ]**, **rwp\_proj\_region\_height[ i ]**, **rwp\_proj\_region\_top[ i ]**, and **rwp\_proj\_region\_left[ i ]** are indicated in relative projected picture sample units.

NOTE 2 – Two projected regions could partially or entirely overlap with each other.

**rw\_packed\_region\_width**[ i ], **rw\_packed\_region\_height**[ i ], **rw\_packed\_region\_top**[ i ], and **rw\_packed\_region\_left**[ i ] specify the width, height, the top luma sample row, and the left-most luma sample column, respectively, of the packed region, either within the region-wise packed picture (when **rw\_constituent\_picture\_matching\_flag** is equal to 0) or within each constituent picture of the region-wise packed picture (when **rw\_constituent\_picture\_matching\_flag** is equal to 1).

**rw\_packed\_region\_width**[ i ], **rw\_packed\_region\_height**[ i ], **rw\_packed\_region\_top**[ i ], and **rw\_packed\_region\_left**[ i ] are indicated in relative region-wise packed picture sample units. **rw\_packed\_region\_width**[ i ], **rw\_packed\_region\_height**[ i ], **rw\_packed\_region\_top**[ i ], and **rw\_packed\_region\_left**[ i ] shall represent integer horizontal and vertical coordinates of luma sample units within the cropped decoded pictures.

NOTE 3 – Two packed regions could partially or entirely overlap with each other.

**rw\_left\_guard\_band\_width**[ i ] specifies the width of the guard band on the left side of the i-th packed region in relative region-wise packed picture sample units. When **ChromaFormatIdc** is equal to 1 (4:2:0 chroma format) or 2 (4:2:2 chroma format), **rw\_left\_guard\_band\_width**[ i ] shall correspond to an even number of luma samples within the cropped decoded picture.

**rw\_right\_guard\_band\_width**[ i ] specifies the width of the guard band on the right side of the i-th packed region in relative region-wise packed picture sample units. When **ChromaFormatIdc** is equal to 1 (4:2:0 chroma format) or 2 (4:2:2 chroma format), **rw\_right\_guard\_band\_width**[ i ] shall correspond to an even number of luma samples within the cropped decoded picture.

**rw\_top\_guard\_band\_height**[ i ] specifies the height of the guard band above the i-th packed region in relative region-wise packed picture sample units. When **ChromaFormatIdc** is equal to 1 (4:2:0 chroma format), **rw\_top\_guard\_band\_height**[ i ] shall correspond to an even number of luma samples within the cropped decoded picture.

**rw\_bottom\_guard\_band\_height**[ i ] specifies the height of the guard band below the i-th packed region in relative region-wise packed picture sample units. When **ChromaFormatIdc** is equal to 1 (4:2:0 chroma format), **rw\_bottom\_guard\_band\_height**[ i ] shall correspond to an even number of luma samples within the cropped decoded picture.

When **rw\_guard\_band\_flag**[ i ] is equal to 1, **rw\_left\_guard\_band\_width**[ i ], **rw\_right\_guard\_band\_width**[ i ], **rw\_top\_guard\_band\_height**[ i ], or **rw\_bottom\_guard\_band\_height**[ i ] shall be greater than 0.

The i-th packed region as specified by this SEI message shall not overlap with any other packed region specified by the same SEI message or any guard band specified by the same SEI message.

The guard bands associated with the i-th packed region, if any, as specified by this SEI message shall not overlap with any packed region specified by the same SEI message or any other guard bands specified by the same SEI message.

**rw\_guard\_band\_not\_used\_for\_pred\_flag**[ i ] equal to 0 specifies that the guard bands might or might not be used in the inter prediction process. **rw\_guard\_band\_not\_used\_for\_pred\_flag**[ i ] equal to 1 specifies that the sample values of the guard bands are not used in the inter prediction process.

NOTE 4 – When **rw\_guard\_band\_not\_used\_for\_pred\_flag**[ i ] is equal to 1, the sample values within guard bands in cropped decoded pictures could be rewritten even if the cropped decoded pictures were used as references for inter prediction of subsequent pictures to be decoded. For example, the content of a packed region could be seamlessly expanded to its guard band with decoded and re-projected samples of another packed region.

**rw\_guard\_band\_type**[ i ][ j ] indicates the type of the guard bands for the i-th packed region as follows, with j equal to 0, 1, 2, or 3 indicating that the semantics apply to the left, right, top, or bottom edge, respectively, of the packed region:

- **rw\_guard\_band\_type**[ i ][ j ] equal to 0 indicates that the content of the guard bands in relation to the content of the packed regions is unknown or unspecified or specified by other means not specified in this Specification. When **rw\_guard\_band\_not\_used\_for\_pred\_flag**[ i ] is equal to 0, **rw\_guard\_band\_type**[ i ][ j ] shall not be equal to 0.
- **rw\_guard\_band\_type**[ i ][ j ] equal to 1 indicates that the content of the guard bands suffices for interpolation of sample values at sub-pel sample fractional locations within the packed region and less than one sample outside of the boundary of the packed region.

NOTE 5 – **rw\_guard\_band\_type**[ i ][ j ] equal to 1 could be used when the boundary samples of a packed region have been copied horizontally or vertically to the guard band.

- **rw\_guard\_band\_type**[ i ][ j ] equal to 2 indicates that the content of the guard bands represents actual picture content that is spherically adjacent to the content in the packed region and is on the surface of the packed region at quality that gradually changes from the picture quality of the packed region to that of the spherically adjacent packed region.

- `rwp_guard_band_type[ i ][ j ]` equal to 3 indicates that the content of the guard bands represents actual picture content that is spherically adjacent to the content in the packed region and is on the surface of the packed region at a similar picture quality as within the packed region.
- `rwp_guard_band_type[ i ][ j ]` values greater than 3 are reserved for future use by ITU-T | ISO/IEC. Decoders shall treat the value of `rwp_guard_band_type[ i ][ j ]` when the value is greater than 3 as equivalent to the value 0.

**`rwp_guard_band_reserved_zero_3bits[ i ]`** shall be equal to 0 in bitstreams conforming to this version of this Specification. Other values for `rwp_guard_band_reserved_zero_3bits[ i ]` are reserved for future use by ITU-T | ISO/IEC. Decoders shall ignore the value of `rwp_guard_band_reserved_zero_3bits[ i ]`.

The variables `NumPackedRegions`, `PackedRegionLeft[ n ]`, `PackedRegionTop[ n ]`, `PackedRegionWidth[ n ]`, `PackedRegionHeight[ n ]`, `ProjRegionLeft[ n ]`, `ProjRegionTop[ n ]`, `ProjRegionWidth[ n ]`, `ProjRegionHeight[ n ]`, and `TransformType[ n ]` are derived as follows:

- For `n` in the range of 0 to `rwp_num_packed_regions – 1`, inclusive, the following applies:
  - `PackedRegionLeft[ n ]` is set equal to `rwp_packed_region_left[ n ]`.
  - `PackedRegionTop[ n ]` is set equal to `rwp_packed_region_top[ n ]`.
  - `PackedRegionWidth[ n ]` is set equal to `rwp_packed_region_width[ n ]`.
  - `PackedRegionHeight[ n ]` is set equal to `rwp_packed_region_height[ n ]`.
  - `ProjRegionLeft[ n ]` is set equal to `rwp_proj_region_left[ n ]`.
  - `ProjRegionTop[ n ]` is set equal to `rwp_proj_region_top[ n ]`.
  - `ProjRegionWidth[ n ]` is set equal to `rwp_proj_region_width[ n ]`.
  - `ProjRegionHeight[ n ]` is set equal to `rwp_proj_region_height[ n ]`.
  - `TransformType[ n ]` is set equal to `rwp_transform_type[ n ]`.
- If `rwp_constituent_picture_matching_flag` is equal to 0, the following applies:
  - `NumPackedRegions` is set equal to `rwp_num_packed_regions`.
- Otherwise (`rwp_constituent_picture_matching_flag` is equal to 1), the following applies:
  - `NumPackedRegions` is set equal to  $2 * \text{rwp\_num\_packed\_regions}$ .
  - When `TopBottomFlag` is equal to 1, the following applies:
    - `projLeftOffset` and `packedLeftOffset` are both set equal to 0.
    - `projTopOffset` is set equal to  $\text{rwp\_proj\_picture\_height} / 2$  and `packedTopOffset` is set equal to  $\text{rwp\_packed\_picture\_height} / 2$ .
  - When `SideBySideFlag` is equal to 1, the following applies:
    - `projLeftOffset` is set equal to  $\text{rwp\_proj\_picture\_width} / 2$  and `packedLeftOffset` is set equal to  $\text{rwp\_packed\_picture\_width} / 2$ .
    - `projTopOffset` and `packedTopOffset` are both set equal to 0.
- For `n` in the range of  $\text{NumPackedRegions} / 2$  to `NumPackedRegions – 1`, inclusive, the following applies:
  - `nIdx` is set equal to  $n - \text{NumPackedRegions} / 2$ .
  - `PackedRegionLeft[ n ]` is set equal to `rwp_packed_region_left[ nIdx ] + packedLeftOffset`.
  - `PackedRegionTop[ n ]` is set equal to `rwp_packed_region_top[ nIdx ] + packedTopOffset`.
  - `PackedRegionWidth[ n ]` is set equal to `rwp_packed_region_width[ nIdx ]`.
  - `PackedRegionHeight[ n ]` is set equal to `rwp_packed_region_height[ nIdx ]`.
  - `ProjRegionLeft[ n ]` is set equal to `rwp_proj_region_left[ nIdx ] + projLeftOffset`.
  - `ProjRegionTop[ n ]` is set equal to `rwp_proj_region_top[ nIdx ] + projTopOffset`.
  - `ProjRegionWidth[ n ]` is set equal to `rwp_proj_region_width[ nIdx ]`.
  - `ProjRegionHeight[ n ]` is set equal to `rwp_proj_region_height[ nIdx ]`.

- TransformType[ n ] is set equal to rwp\_transform\_type[ nIdx ].

For each value of n in the range of 0 to NumPackedRegions – 1, inclusive, the values of ProjRegionWidth[ n ], ProjRegionHeight[ n ], ProjRegionTop[ n ], and ProjRegionLeft[ n ] are constrained as follows:

- ProjRegionWidth[ n ] shall be in the range of 1 to rwp\_proj\_picture\_width, inclusive.
- ProjRegionHeight[ n ] shall be in the range of 1 to rwp\_proj\_picture\_height, inclusive.
- ProjRegionLeft[ n ] shall be in the range of 0 to rwp\_proj\_picture\_width – 1, inclusive.
- ProjRegionTop[ n ] shall be in the range of 0 to rwp\_proj\_picture\_height – 1, inclusive.
- If ProjRegionTop[ n ] is less than  $rwp\_proj\_picture\_height / VerDiv1$ , the sum of ProjRegionTop[ n ] and ProjRegionHeight[ n ] shall be less than or equal to  $rwp\_proj\_picture\_height / VerDiv1$ . Otherwise, the sum of ProjRegionTop[ n ] and ProjRegionHeight[ n ] shall be less than or equal to  $rwp\_proj\_picture\_height / VerDiv1 * 2$ .

For each value of n in the range of 0 to NumPackedRegions – 1, inclusive, the values of PackedRegionWidth[ n ], PackedRegionHeight[ n ], PackedRegionTop[ n ], and PackedRegionLeft[ n ] are constrained as follows:

- PackedRegionWidth[ n ] shall be in the range of 1 to rwp\_packed\_picture\_width, inclusive.
- ProjRegionHeight[ n ] shall be in the range of 1 to rwp\_packed\_picture\_height, inclusive.
- PackedRegionLeft[ n ] shall be in the range of 0 to rwp\_packed\_picture\_width – 1, inclusive.
- PackedRegionTop[ n ] shall be in the range of 0 to rwp\_packed\_picture\_height – 1, inclusive.
- If PackedRegionLeft[ n ] is less than  $rwp\_packed\_picture\_width / HorDiv1$ , the sum of PackedRegionLeft[ n ] and PackedRegionWidth[ n ] shall be less than or equal to  $rwp\_packed\_picture\_width / HorDiv1$ . Otherwise, the sum of PackedRegionLeft[ n ] and PackedRegionWidth[ n ] shall be less than or equal to  $rwp\_packed\_picture\_width / HorDiv1 * 2$ .
- If PackedRegionTop[ n ] is less than  $rwp\_packed\_picture\_height / VerDiv1$ , the sum of PackedRegionTop[ n ] and PackedRegionHeight[ n ] shall be less than or equal to  $rwp\_packed\_picture\_height / VerDiv1$ . Otherwise, the sum of PackedRegionTop[ n ] and PackedRegionHeight[ n ] shall be less than or equal to  $rwp\_packed\_picture\_height / VerDiv1 * 2$ .
- When ChromaFormatIdc is equal to 1 (4:2:0 chroma format) or 2 (4:2:2 chroma format), PackedRegionLeft[ n ] shall correspond to an even horizontal coordinate value of luma sample units, and PackedRegionWidth[ n ] shall correspond to an even number of luma samples, both within the decoded picture.
- When ChromaFormatIdc is equal to 1 (4:2:0 chroma format), PackedRegionTop[ n ] shall correspond to an even vertical coordinate value of luma sample units, and ProjRegionHeight[ n ] shall correspond to an even number of luma samples, both within the decoded picture.

## 8.15.6 Omnidirectional viewport SEI message

### 8.15.6.1 Omnidirectional viewport SEI message syntax

### 8.15.6.2 Omnidirectional viewport SEI message semantics

The omnidirectional viewport SEI message specifies the coordinates of one or more regions of spherical-coordinate geometry, bounded by four great circles, corresponding to viewports recommended for display when the user does not have control of the viewing orientation or has released control of the viewing orientation.

When an effectively applicable frame packing arrangement SEI message, as specified in clause 8.15.2.2 or clause 8.15.3.2, that applies to the picture is present, the information indicated by the omnidirectional viewport SEI message applies to both views.

**omni\_viewport\_id** contains an identifying number that may be used to identify the purpose of the one or more recommended viewport regions.

omni\_viewport\_id equal to 0 indicates that the recommended viewports are per "director's cut", i.e., a viewport suggested according to the creative intent of the content author or content provider. omni\_viewport\_id equal to 1 indicates that the recommended viewports are selected based on measurements of viewing statistics.

Values of omni\_viewport\_id from 2 to 511, inclusive, may be used as determined by the application. Values of omni\_viewport\_id from 512 to 1023 are reserved for future use by ITU-T | ISO/IEC. Decoders encountering a value of omni\_viewport\_id in the range of 512 to 1023, inclusive, shall ignore it.

**omni\_viewport\_cancel\_flag** equal to 1 indicates that the SEI message cancels the persistence of any previous omnidirectional viewport SEI message in output order. omni\_viewport\_cancel\_flag equal to 0 indicates that omnidirectional viewport information follows.

**omni\_viewport\_persistence\_flag** specifies the persistence of the omnidirectional viewport SEI message for the current layer.

omni\_viewport\_persistence\_flag equal to 0 specifies that the omnidirectional viewport SEI message applies to the current decoded picture only.

omni\_viewport\_persistence\_flag equal to 1 specifies that the omnidirectional viewport SEI message applies to the current decoded picture and persists for all subsequent pictures of the current layer in output order until one or more of the following conditions are true:

- A new CLVS of the current layer begins.
- The bitstream ends.
- A picture in the current layer in an AU associated with an omnidirectional viewport SEI message is output that follows the current picture in output order.

When no omnidirectional video projection is indicated to apply to a picture, e.g., by an equirectangular projection SEI message with erp\_cancel\_flag equal to 0 or a generalized cubemap projection SEI message with gcmp\_cancel\_flag equal to 0 being present in the CLVS that applies to the current picture, an omnidirectional viewport SEI message with omni\_viewport\_cancel\_flag equal to 0 shall not be present in the CLVS that applies to the picture. Decoders shall ignore omnidirectional viewport SEI messages with omni\_viewport\_cancel\_flag equal to 0 for pictures to which no omnidirectional video projection is indicated to apply.

**omni\_viewport\_cnt\_minus1** plus 1 specifies the number of recommended viewport regions that are indicated by the SEI message.

When omni\_viewport\_cnt\_minus1 is greater than 0 and there is no information provided by external means not specified in this Specification on which recommended viewport is suggested to be displayed, the following applies:

- When omni\_viewport\_id is equal to 0 or 1, the 0-th recommended viewport is suggested to be displayed when the user does not have control of the viewing orientation or has released control of the viewing orientation.
- When omni\_viewport\_id is equal to 0, between any two recommended viewports per director's cut, the i-th recommended viewport has higher priority than the j-th recommended viewport for any values of i and j when i is less than j. The 0-th recommended viewport per director's cut has the highest priority.
- When omni\_viewport\_id is equal to 1, between any two recommended viewports, the i-th recommended viewport has higher popularity, among some selection of candidate viewports, than the j-th recommended viewport for any values of i and j when i is less than j. The 0-th most-viewed recommended viewport has the highest popularity. The selection of the candidate viewports is outside the scope of this Specification.

**omni\_viewport\_azimuth\_centre**[ i ] and **omni\_viewport\_elevation\_centre**[ i ] indicate the centre of the i-th recommended viewport region, in units of  $2^{-16}$  degrees relative to the global coordinate axes. The value of **omni\_viewport\_azimuth\_centre**[ i ] shall be in the range of  $-180 * 2^{16}$  (i.e., -11 796 480) to  $180 * 2^{16} - 1$  (i.e., 11 796 479), inclusive. The value of **omni\_viewport\_elevation\_centre**[ i ] shall be in the range of  $-90 * 2^{16}$  (i.e., -5 898 240) to  $90 * 2^{16}$  (i.e., 5 898 240), inclusive.

**omni\_viewport\_tilt\_centre**[ i ] indicates the tilt angle of the i-th recommended viewport region, in units of  $2^{-16}$  degrees. The value of **omni\_viewport\_tilt\_centre**[ i ] shall be in the range of  $-180 * 2^{16}$  (i.e., -11 796 480) to  $180 * 2^{16} - 1$  (i.e., 11 796 479), inclusive.

**omni\_viewport\_hor\_range**[ i ] indicates the azimuth range of the i-th recommended viewport region, in units of  $2^{-16}$  degrees. The value of **omni\_viewport\_hor\_range**[ i ] shall be in the range of 1 to  $360 * 2^{16}$  (i.e., 23 592 960), inclusive.

**omni\_viewport\_ver\_range**[ i ] indicates the elevation range of the i-th recommended viewport region, in units of  $2^{-16}$  degrees. The value of **omni\_viewport\_ver\_range**[ i ] shall be in the range of 1 to  $180 * 2^{16}$  (i.e., 11 796 480), inclusive.

## 8.16 Frame-field information SEI message

### 8.16.1 Frame-field information SEI message syntax

### 8.16.2 Frame-field information SEI message semantics

The frame-field information SEI message may be used to indicate how the associated picture should be displayed (although this is merely a suggestion rather than a prescription, as the display process is outside the scope of this Specification), the source scan type of the associated picture, and whether the associated picture is a duplicate of a previous picture, in output order, of the same layer.

Use of this SEI message requires the definition of the following variables:

- A fixed picture rate indicator associated with a temporal sublayer, denoted herein by **FixedPicRateWithinCvsFlag**, such that value 1 indicates that the temporal distance between the display times of consecutive pictures in output order is constrained and value 0 indicates no such constraint.
- A display elemental period indicator, denoted herein by **DisplayElementalPeriods**, that indicates the number of elemental picture period intervals that the current coded picture occupies for the display model.

**ffi\_field\_pic\_flag** equal to 1 indicates that the display model considers the current picture as a field, and **ffi\_field\_pic\_flag** equal to 0 indicates that the display model considers the current picture as a frame.

**ffi\_bottom\_field\_flag** equal to 1, when present, indicates that the current picture is a bottom field (i.e., that the parity of the current picture is bottom). **ffi\_bottom\_field\_flag** equal to 0 indicates that the current picture is a top field (i.e., that the parity of the current picture is top). The two parities, bottom and top, are considered as opposite parities.

**ffi\_pairing\_indicated\_flag** equal to 1, when present, indicates that the current picture is considered paired with the next picture in output order or with the previous picture in output order as the two fields of a frame. **ffi\_pairing\_indicated\_flag** equal to 0, when present, indicates that a pairing of the current picture with another picture to form a frame is not expressed.

**ffi\_paired\_with\_next\_field\_flag** equal to 1, when present, indicates that the current picture is considered paired with the next picture as the two fields of a frame. **ffi\_paired\_with\_next\_field\_flag** equal to 0, when present, indicates that the current picture is considered paired with the previous picture as the two fields of a frame.

When **ffi\_paired\_with\_next\_field\_flag** is present, the following constraints shall apply

- If **ffi\_paired\_with\_next\_field\_flag** is equal to 0, there shall be at least one picture in the CLVS that precedes the current picture in output order and the picture that precedes the current picture in output order shall have the opposite parity and **ffi\_pairing\_indicated\_flag** equal to 1 and the value of **ffi\_paired\_with\_next\_field\_flag** for that preceding picture in output order shall be equal to 1.
- Otherwise, there shall be at least one picture in the CLVS that follows the current picture in output order and the picture that follows the current picture in output order shall have the opposite parity and **ffi\_pairing\_indicated\_flag** equal to 1 and the value of **ffi\_paired\_with\_next\_field\_flag** for that following picture in output order shall be equal to 0.

**ffi\_display\_fields\_from\_frame\_flag** equal to 1, when present, indicates that the display model operates by sequentially displaying the individual fields of the frame with alternating parity. **ffi\_display\_fields\_from\_frame\_flag** equal to 0, when present, indicates that the display model operates by displaying the current picture as a complete frame.

**ffi\_top\_field\_first\_flag** equal to 1, when present, indicates that the first field of the frame that is displayed by the display model is the top field. **ffi\_top\_field\_first\_flag** equal to 0, when present, indicates that the first field of the frame that is displayed by the display model is the bottom field.

**ffi\_display\_elemental\_periods\_minus1** plus 1, when present, indicates the number of elemental picture period intervals that the current coded picture or field occupies for the display model. The value of **ffi\_display\_elemental\_periods\_minus1** shall be equal to `DisplayElementalPeriods - 1`.

The interpretation of combinations of **ffi\_field\_pic\_flag**, `FixedPicRateWithinCvsFlag`, **ffi\_bottom\_field\_flag**, **ffi\_display\_fields\_from\_frame\_flag**, **ffi\_top\_field\_first\_flag**, and **ffi\_display\_elemental\_periods\_minus1** (through `DisplayElementalPeriods`) is specified in Table 14, in which syntax elements that are not present are indicated by "-". Combinations of syntax elements that are not listed in Table 14 are reserved for future use by ITU-T | ISO/IEC and shall not be present in bitstreams conforming to this version of this Specification.

NOTE 1 – When `FixedPicRateWithinCvsFlag` is equal to 1, the indicated display times are constrained to account for time duration for a display model that follows the display patterns indicated by the values of the syntax elements of the frame-field information SEI message (although the display process is outside the scope of this Specification). Although the video decoder model might be specified to only output the entire cropped decoded picture, the modelled display behaviour sometimes includes other steps, such as the repeated display of a frame for multiple time intervals when **ffi\_display\_fields\_from\_frame\_flag** is equal to 0 or the sequential display of the individual fields of a frame when **ffi\_display\_fields\_from\_frame\_flag** is equal to 1.

NOTE 2 – Frame doubling can be used to facilitate the display, for example, of 25 Hz progressive-scan video on a 50 Hz progressive-scan display or 30 Hz progressive-scan video on a 60 Hz progressive-scan display. Using frame doubling and frame tripling in alternating combination on every other frame could be used to facilitate the display of 24 Hz progressive-scan video on a 60 Hz progressive-scan display.

**Table 14 – Interpretation of frame-field information syntax elements**

ffi_field_pic_flag	FixedPicRateWithinCvsFlag	ffi_bottom_field_flag	ffi_display_fields_from_frame_flag	ffi_top_field_flag	DisplayElementalPeriods		Indicated display of the picture by the display model
0	0	-	0	-	1		(progressive) Frame
		-	1	0	2		Bottom field, top field, in that order
		-	1	1	2		Top field, bottom field, in that order
		-	1	0	3		Bottom field, top field, bottom field repeated, in that order
		-	1	1	3		Top field, bottom field, top field repeated, in that order
	1	-	0	-	n		(progressive) Frame displayed for n elemental periods of time
		-	1	0	2		Bottom field, top field, in that order, each displayed for 1 elemental period of time
		-	1	1	2		Top field, bottom field, in that order, each displayed for 1 elemental period of time
		-	1	0	3		Bottom field, top field, bottom field repeated, in that order, each displayed for 1 elemental period of time
		-	1	1	3		Top field, bottom field, top field repeated, in that order, each displayed for 1 elemental period of time
1	0	0	-	-	1		Top field
		1	-	-	1		Bottom field
	1	0	-	-	1		Top field displayed for 1 elemental period of time
		1	-	-	-		Bottom field displayed for 1 elemental period of time

**ffi\_source\_scan\_type** equal to 1 indicates that the source scan type of the associated picture should be interpreted as progressive. **ffi\_source\_scan\_type** equal to 0 indicates that the source scan type of the associated picture should be interpreted as interlaced. **ffi\_source\_scan\_type** equal to 2 indicates that the source scan type of the associated picture is unknown or unspecified or specified by other means not specified in this Specification. **ffi\_source\_scan\_type** equal to 3 is reserved for future use by ITU-T | ISO/IEC and shall not be present in bitstreams conforming to this version of this Specification. Decoders conforming to this version of this Specification shall interpret the value 3 for **ffi\_source\_scan\_type** as equivalent to the value 2.

**ffi\_duplicate\_flag** equal to 1 indicates that the current picture is indicated to be a duplicate of a previous picture in output order. **ffi\_duplicate\_flag** equal to 0 indicates that the current picture is not indicated to be a duplicate of a previous picture in output order.

NOTE 3 – The **ffi\_duplicate\_flag** could be used to mark coded pictures known to have originated from a repetition process such as "3:2 pull-down" or other such duplication and picture rate interpolation methods. This flag would commonly be used when a video feed is encoded as a field sequence in a "transport pass-through" fashion, with known duplicate pictures tagged by setting **ffi\_duplicate\_flag** equal to 1.

NOTE 4 – When `ffi_field_pic_flag` is equal to 1 and `ffi_duplicate_flag` is equal to 1, this could be interpreted as an indication that the AU contains a field that duplicates the content of the previous field in output order with the same parity as the current field.

## 8.17 Sample aspect ratio information SEI message

### 8.17.1 Sample aspect ratio information SEI message syntax

	Descriptor
<code>sample_aspect_ratio_info( payloadSize ) {</code>	
<b>sari_cancel_flag</b>	u(1)
<code>if( !sari_cancel_flag ) {</code>	
<b>sari_persistence_flag</b>	u(1)
<b>sari_aspect_ratio_idc</b>	u(8)
<code>if( sari_aspect_ratio_idc == 255 ) {</code>	
<b>sari_sar_width</b>	u(16)
<b>sari_sar_height</b>	u(16)
<code>}</code>	
<code>}</code>	
<code>}</code>	

### 8.17.2 Sample aspect ratio information SEI message semantics

The SARI SEI message provides information about the sample aspect ratio of the samples of the associated decoded pictures. When `vui_aspect_ratio_constant_flag` is equal to 1, there shall be no SARI SEI messages present in the CLVS.

**sari\_cancel\_flag** equal to 1 indicates that the SARI SEI message cancels the persistence of any previous SARI SEI messages in output order that applies to the current layer. **sari\_cancel\_flag** equal to 0 indicates that SARI follows.

**sari\_persistence\_flag** specifies the persistence of the SARI SEI message for the current layer.

**sari\_persistence\_flag** equal to 0 specifies that the SARI applies to the current decoded picture only.

**sar\_persistence\_flag** equal to 1 specifies that the SARI SEI message applies to the current decoded picture and persists for all subsequent pictures of the current layer in output order until one or more of the following conditions are true:

- A new CLVS of the current layer begins.
- The bitstream ends.
- A picture in the current layer in an AU associated with a SARI SEI message is output that follows the current picture in output order.

**sari\_aspect\_ratio\_idc**, when not equal to 255, indicates the sample aspect ratio of the luma samples of the decoded output picture, with the same semantics as specified for the `SampleAspectRatio` parameter in Rec. ITU-T H.273 | ISO/IEC 23091-2. When the `sari_aspect_ratio_idc` syntax element is not present, the value of `sari_aspect_ratio_idc` is inferred to be equal to 0. Values of `sari_aspect_ratio_idc` that are specified as reserved for future use in Rec. ITU-T H.273 | ISO/IEC 23091-2 shall not be present in bitstreams conforming to this version of this Specification. Decoders shall interpret values of `sari_aspect_ratio_idc` that are reserved for future use in Rec. ITU-T H.273 | ISO/IEC 23091-2 as equivalent to the value 0.

**sari\_sar\_width**, when present, indicates the horizontal size of the sample aspect ratio (in an arbitrary unit).

**sari\_sar\_height**, when present, indicates the vertical size of the sample aspect ratio (in the same arbitrary unit as `sari_sar_width`).

When present, `sari_sar_width` and `sari_sar_height` shall be relatively prime or equal to 0. When `sari_aspect_ratio_idc` is equal to 0 or `sari_sar_width` is equal to 0 or `sari_sar_height` is equal to 0, the sample aspect ratio is unknown or unspecified or specified by other means not specified in this Specification.

## 8.18 Reserved SEI message

### 8.18.1 Reserved SEI message syntax

reserved_message( payloadSize ) {	<b>Descriptor</b>
for( i = 0; i < payloadSize; i++ )	
<b>reserved_message_payload_byte</b>	u(8)
}	

### 8.18.2 Reserved SEI message semantics

The reserved SEI message consists of data reserved for future backward-compatible use by ITU-T | ISO/IEC. Unless otherwise specified by a referencing specification, coded video bitstreams shall not contain reserved SEI messages and systems that make use of such coded video bitstreams shall not otherwise send reserved SEI messages until and unless the use of such messages has been specified by ITU-T | ISO/IEC. Decoders shall ignore reserved SEI messages.

**reserved\_message\_payload\_byte**, when present, has values to be specified in the future by ITU-T | ISO/IEC.

## 9 Parsing process for k-th order Exp-Golomb codes

### 9.1 General

This process is invoked when the descriptor of a syntax element in the syntax tables is equal to ue(v) or se(v).

Inputs to this process are bits from the bitstream.

Outputs of this process are syntax element values.

Syntax elements coded as ue(v) or se(v) are Exp-Golomb-coded with order k equal to 0. The parsing process for these syntax elements begins with reading the bits starting at the current location in the bitstream up to and including the first non-zero bit, and counting the number of leading bits that are equal to 0. This process is specified as follows:

```

leadingZeroBits = -1
for( b = 0; !b; leadingZeroBits++ )
    b = read_bits( 1 )
    
```

(47)

The variable codeNum is then assigned as follows:

$$\text{codeNum} = ( 2^{\text{leadingZeroBits}} - 1 ) * 2^k + \text{read\_bits}( \text{leadingZeroBits} + k )$$
(48)

where the value returned from read\_bits( leadingZeroBits ) is interpreted as a binary representation of an unsigned integer with most significant bit written first.

Table 15 illustrates the structure of the 0-th order Exp-Golomb code by separating the bit string into "prefix" and "suffix" bits. The "prefix" bits are those bits that are parsed as specified for the computation of leadingZeroBits, and are shown as either 0 or 1 in the bit string column of Table 15. The "suffix" bits are those bits that are parsed in the computation of codeNum and are shown as x<sub>i</sub> in Table 15, with i in the range of 0 to leadingZeroBits – 1, inclusive. Each x<sub>i</sub> is equal to either 0 or 1.

**Table 15 – Bit strings with "prefix" and "suffix" bits and assignment to codeNum ranges (informative)**

Bit string form	Range of codeNum
1	0
0 1 x <sub>0</sub>	1..2
0 0 1 x <sub>1</sub> x <sub>0</sub>	3..6
0 0 0 1 x <sub>2</sub> x <sub>1</sub> x <sub>0</sub>	7..14
0 0 0 0 1 x <sub>3</sub> x <sub>2</sub> x <sub>1</sub> x <sub>0</sub>	15..30
0 0 0 0 0 1 x <sub>4</sub> x <sub>3</sub> x <sub>2</sub> x <sub>1</sub> x <sub>0</sub>	31..62
...	...

Table 16 illustrates explicitly the assignment of bit strings to codeNum values.

**Table 16 – Exp-Golomb bit strings and codeNum in explicit form and used as ue(v) (informative)**

Bit string	codeNum
1	0
0 1 0	1
0 1 1	2
0 0 1 0 0	3
0 0 1 0 1	4
0 0 1 1 0	5
0 0 1 1 1	6
0 0 0 1 0 0 0	7
0 0 0 1 0 0 1	8
0 0 0 1 0 1 0	9
...	...

Depending on the descriptor, the value of a syntax element is derived as follows:

- If the syntax element is coded as ue(v), the value of the syntax element is equal to codeNum.
- Otherwise (the syntax element is coded as se(v)), the value of the syntax element is derived by invoking the mapping process for signed Exp-Golomb codes as specified in clause 9.2 with codeNum as input.

## 9.2 Mapping process for signed Exp-Golomb codes

Input to this process is codeNum as specified in clause 9.1.

Output of this process is a value of a syntax element coded as se(v).

The syntax element is assigned to the codeNum by ordering the syntax element by its absolute value in increasing order and representing the positive value for a given absolute value with the lower codeNum. Table 17 provides the assignment rule.

**Table 17 – Assignment of syntax element to codeNum for signed Exp-Golomb coded syntax elements se(v)**

codeNum	syntax element value
0	0
1	1
2	-1
3	2
4	-2
5	3
6	-3
k	$(-1)^{k+1} * \text{Ceil}(k \div 2)$
